

SPECIFICATIONS & APPLICATION HANDBOOK Edition 30

December 2009

Please note that the performance information included in this book is for estimation purposes only. It is based on information that Komatsu Ltd. has but actual figures will vary with the operating conditions, including material characteristics, site conditions, operator efficiency, etc. Neither Komatsu Ltd. nor its dealers will guarantee that the machines will perform as estimated.

Materials and specifications are subject to change without notice.

PREFACE

This handbook refers to machine specifications, productivity and owning & operation cost for construction equipment sold by Komatsu. It serves as a guide for the following cases:

- * Estimation of productivity for each machine
- * Estimation of owning & operating costs for each machine
- * Selection of machines for purchasing construction equipment
- * Selection of machines for performing construction job

The performance of a machine is determined by its production and operating costs. Important machine factors that influence production includes the horsepower, operating weight, capacity of work equipment, traveling speed and types of mechanical, hydraulic and electrical systems. They are referred to in the related section in the handbook. Some of the significant elements that comprise the operating cost factors are the consumption of fuel and lubricants, the service life of tires and undercarriage and the repair cost of components. These expenditures are discussed in the section entitled Owning & Operating Costs.

The data and tables in the handbook are based on Komatsu's bench and field tests, computer analysis and many years of experience. We continuously conduct tests to improve the reliability of the data. However, because of the complexity of factors influencing production costs and the deviations that may occur during the preparation of data, Komatsu does not guarantee that the data is exact and that the performance shown in the handbook is always obtainable with the given job conditions.

The basic performance data in the handbook are the values when machines are used at ideal efficiency. As performance varies with operator's skill, ground and weather conditions, etc., in reality, the basic data needs to be modified by using the various factors included in the handbook, resulting in different figures depending on the selection of these factors. Owning and operating cost also varies depending upon the machine usage, and the calculation result differs by what job condition and factors are applied for the calculation. Therefore, it should be understood that the calculated figures do not always completely match the actual measured data. Nevertheless, handbook users will be able to make proper approximate calculations based on the data given in the handbook, their work experience and knowledge of local conditions.

This handbook is revised yearly. The data in the handbook is accurate at the time of printing; however, Komatsu may make changes in the specifications and materials without notice. Changes are made because of Komatsu's fundamental program of conducting continuous improvements on its products. Therefore, when you need the most updated information or specifications, obtain the latest catalogs through your distributor.

This handbook contains machine models produced in the various areas in the world. Specifications may vary depending upon production location; all models are not always available everywhere in the world.

The final objective for an owner of construction equipment is to perform the necessary construction job with the best efficiency and safety. It is desirable for an owner to understand the job efficiency factors and the machine use factors before utilizing this handbook.

They are as follows:

1. Job efficiency factors

1) Skill of operator

In order to obtain high productivity, the skill of the operator needs to match the performance of the machine. It is essential that the operator has the knowledge and skill to obtain high productivity from the machine.

Therefore, operators should be given education and training about machine operation, construction job operations and safety. The operator must read and understand the operator's manual. The operator must also read and understand the safety manual of the applicable manufacturers association in each area (AEM in USA, CECE in Europe, etc). The employer should assess the skill of each operator and assign the operator to an appropriate job. The operator should be given clear job instruction.

2) Selection of type of machine and specification

The contractor should select the kind, size and specification of machine that can obtain the optimum job efficiency. The contractor can use his past results and experience to select the most appropriate machine. If the contractor is uncertain about the proper machine selection, it is recommended that the contractor consult with the Komatsu distributor or the Komatsu application engineer. They have abundant information and experience and can provide valuable assistance in machine selection.

3) Selection of construction method

To attain the job objective, the contractor must select the proper method of construction or process. The contractor can choose the optimal method of construction and the optimal process by past actual result or experience. If the contractor is uncertain about the selection, it is recommended that the contractor consult a Komatsu application engineer. Komatsu has a program called OFR (Optimum Fleet Recommendation), which provides suitable recommendations for optimal method of construction and process.

4) Choice and use of attachments and optional parts

Care should be taken in the selection of attachments or optional parts since they affect work efficiency and safety. Typical attachments and optional parts are shown in this handbook. Komatsu has additional attachments and optional parts. You can consult with the distributor, salesman, or Komatsu application engineer for additional details.

5) Use of special application machine

This handbook includes relatively popular special application machines (modified machine for special application), but does not include every special application machine because of the limited number of pages. Komatsu will evaluate individual special application work which is not shown in this handbook and may create a special application machine to meet job requirements. You can consult with the distributor, salesman, or application engineer of Komatsu.

2. Machine use factors

1) Operator's protection from hazard

The employer has a duty to secure the safety of operators. They must not start work until they understand the machines to be used, method of construction and job site, and until they check and confirm that the operator is protected from all potential hazards.

- If an additional protection device is needed on the machine for operator protection, the Komatsu distributor should be consulted.
- The owner of a machine for the purpose of raising productivity and durability may want to modify a machine. In such a case, any modifications and attachment installations that may endanger the operator must not be carried out. For example, modifications that hinder an operator's field of view, hinder operation of a machine, hinder access to a machine or worsen the function of brake, steering and ROPS, stability of a machine, etc., must not be performed.

2) Protection from breakdown or lessening of machine life

In order to lower O&O cost, it is important to lengthen the economical life of a machine while reducing machine failure. Therefore, the owner of a machine needs to address the following items:

- Understand the method of construction and the condition of job site, and choose the type, size, and specification of machine that has ample strength for the job. Komatsu machines are equipped with the adequate strength and structure for typical work. However, when the machine is used in special applications, special strengthening and/or the addition of protection structures may be needed. In such a case, it is recommended that Komatsu should be consulted through the distributor. If the owner of the machine makes modification himself without consulting Komatsu, there are risks of generating problems in the performance, durability and safety of the machine.
- To increase production or durability, the owner of a machine may want to convert a main part of the machine or attachments himself, or may want to put attachments other than a Komatsu design which is procured locally, even if it is not a special application. In such a case, it is recommended that Komatsu be consulted through the distributor. Komatsu will propose through the distributor the proper means to respond to the request of a customer. If the owner of the machine makes modification himself without consulting Komatsu, there are risks of generating problems in the performance, durability and safety of the machine.

3) Prevention of fire

The owner and operator of a construction machine must follow the machine's maintenance guidelines and manage the job so that danger of fire will be minimized. A fire breaks out mainly by leakage of fuel, oil and grease; by electrical shorts caused from fatigue, loosening, or rubbing of electric parts and by ignition from engine high temperature parts contacting combustibles, such as plants and papers.

- The owner of a machine needs to maintain a machine by daily checks so that the causes described above do not exist.
- The operator must confirm by walk-around check before starting the machine that the above-mentioned hazards do not exist. If any problems are found, the machine must not be started until the problems are fixed.
- Equip a machine with a fire extinguisher in preparation for emergency.

4) Consideration of safety around the machine and environment.

Exercise care regarding safety, vibration, noise and flying debris (soil and stone) for the people who work around machines and for the surrounding area before putting a machine into a job site.

- Due to carelessness, the people working around the machine may suffer injury when the machine reverses, turns, and the attachment moves, etc. In order to prevent injuries, Komatsu can offer hazard alarm equipment and hazard detection equipment on its machines and the clothing of people working around the machine. The owner of the machine should evaluate whether the equipment on the machine are enough to cover the job site condition and should equip the machine and the people with additional equipment if needed.
- Komatsu sells machines that conform to the surrounding noise level regulation in the area sold. However, when it is necessary to have lower noise than a regulation level of the area, it is possible to reduce noise levels by modifying the machine. You are requested to consult Komatsu through its distributor.
- It is quite difficult to prevent the vibration of the land and flying debris by modification of the machine. Such problems should be solved by changing the work condition.

5) Compliance with regulations

Regulations pertaining to safety, noise, engine exhaust gas, etc. vary in different areas of the world. The owner of a machine has to recognize the regulations about the safety and environment legislated by each country and local government against construction machines, and has to use machines that conform to the applicable regulations. Although Komatsu supplies machines that conform to each regulation in the world, it is necessary to confirm through the Komatsu distributor if the machine conforms to all regulations in that area, before putting the machine to work.

Occasionally, a machine manufactured for another area in the world may be moved and relocated without Komatsu's knowledge. In this case, the machine may not have the specifications or structure to satisfy regulations of the area where the machine is located. In such a case, check in advance to determine if it conforms to the regulation of the area. If it does not conform, the owner must either make the necessary modifications to the machine to make it conform, or not operate the machine there.

6) Appropriate maintenance and management of a machine

The most important factor to maximize machine operation is performing maintenance and management of the machine correctly. It is essential to perform daily check & maintenance and periodic inspection & maintenance procedures shown in the operation manual of each machine.

● **BULLDOZERS**

Horsepower 32.4 to 858 kW (43.4 to 1150 HP)

■ High productivity

The high-power engine, highly efficient power train, large drawbar pull provided by the conventional undercarriage, and the high performance work equipment provide high productivity.

● Large capacity blade

Large capacity blade, powerful digging force, large up-and-down movement of the blade, and high strength provided by high tensile steel.

● Uniquely designed ripper

The unique linkage design enables the ripper point to draw an ideal locus during cylinder tilting for effective excavation of embedded rocks.

● Automatic lock-up torque converter

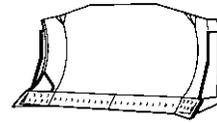

When the lock-up clutch is engaged, the pump and the turbine are virtually connected and the internal power loss of the torque converter is minimized. (D275AX, D375A and D475A)

● Resilient Equalized Undercarriage (REU)

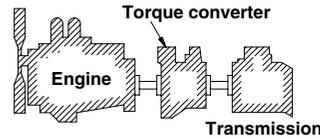

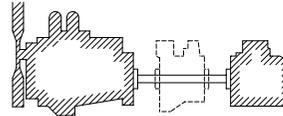

This highly advanced undercarriage system utilizes an X-shape bogie structure with an independent see-saw movement for the track rollers. This allows the shoes to always follow the contour of the ground for excellent traction. The bogies contact the track frame through rubber shock absorber reduces vibration and shock. (D155A-5, D155AX-6 and D575A)

■ Dependable and high-performance components

- Komatsu's diesel engine delivers a strong horsepower and has a direct-injection system for fuel savings and cleaner exhaust.
- The TORQFLOW transmission not only ensures smooth and responsive power shifting, but also makes instant speed and directional changes by a single lever.
- The HYDROSHIFT transmission ensures not only efficient power transmitting ability for reduced fuel costs, but also a single-lever speed control and F/R directional changes for easy operation. (D21)
- Wet, multiple-disc type steering clutches and brakes ensure long service life and eliminate troublesome brake-lining adjustments. (D65, D155A-5, D275A, D375A, D475A and D575A)
- Double reduction final drives feature a large reduction ratio and minimize shocks to the power train components and extend the life of components. [Except D21]
- Lubricated track links: Since the clearance between the link pin and bushing is lubricated, wear and pitch extensions are minimized for extended service life.
- Unique dust seals prevent dust from entering into pin-to-bushing clearance for extended service.
- Floating seals in the idlers and rollers keep dirt out and lubricant in for durable operation.

Features

CRAWLER-TYPE TRACTORS

- Reduction of man-hours for turning over the bushings by employment of wedge ring. (Large Class)
- Strengthening of undercarriage by increase of press fitting width of pin. (Small-middle Class)
The most important matters for the undercarriage of a bulldozer are holding of the oil filled in the links and easiness of turning over the bushings. KOMATSU increased the rigidity and abrasion life of the links and lowered the press fitting force of the pins to reduce scuffing when the links are disassembled. As a result, the bushings are turned over extremely easily. It's the link, the repair cost of the undercarriage of a bulldozer is the highest of all. You can reduce the repair cost with the turning over the bushings drastically.

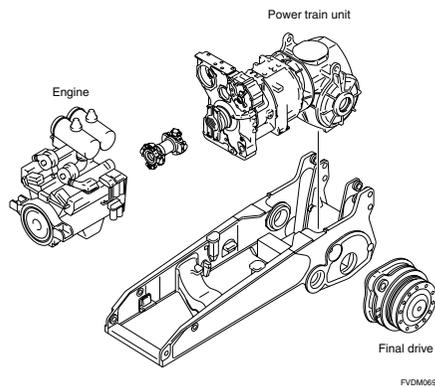

Repair cost of the undercarriage

• Modular design

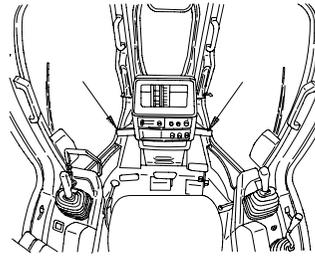

The sealed, modular design allows the power-train components to be mounted / dismantled without any oil spillage, making servicing work clean, smooth and easy. (D61, D65, D155A-5, D155AX, D275, D375A, D475A and D575A)

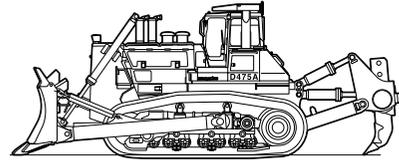

FVDM0692

■ Easy operation / Operator comfort

- Operator-oriented arrangement of control levers, pedals, instruments and operator seat.
- Walk-through operator compartment provides easy boarding and exiting.
- Operator seat can be adjusted to provide the most suitable operating posture.
- Steering clutches and brakes are interconnected for easy operation.
- Low profile design assures excellent machine balance and a low center of gravity, making machine dynamically stable and controllable, accounting for operator confidence and comfort.
- Oscillating type equalizer bar suspension absorbs vibrations and shocks for high mobility and comfortable ride even on rugged terrain. [Except D21, D31, D37 and D39]

FLD00456

FZDM0699

• Wrist-control-type single lever for steering/directional and speed change

All speed and directional changes, 1st to 3rd forward and reverse, and right-and left-hand steering are controlled with just a joystick single-lever on the left. (D21, D65 and D155A-5/ D155AX)

• Blade control joystick

Blade lift, angle and tilt operations are instantly accomplished with a joystick right single-lever. The introduction of this left and right "joystick" system permits simultaneous traveling and working, offering both ease and a shorter cycle time. (D21 and D61)

• Hydrostatic steering system (HSS)

Engine power is ideally distributed to the left and right tracks in portion to lever movement each time the machine makes a turn; the outside track moves faster and the inside slower, providing a smooth and powerful turn. (D31/D37/D39-22, D61, D65EX/PX, D85EX/PX, D155AX and D275AX)

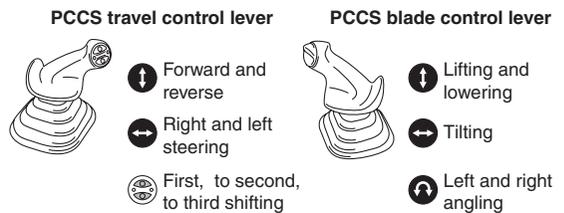

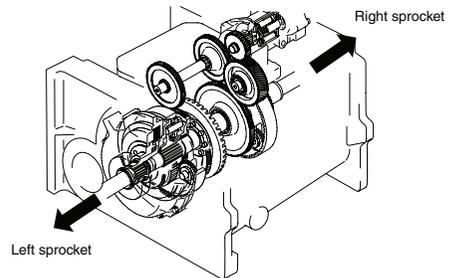

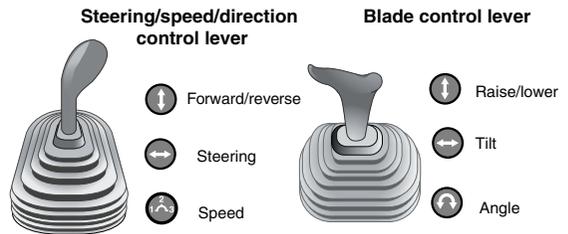

• Palm Command Control System

Palm Command Control System (PCCS) joystick controls for all directional movements. Pushing the joystick forward results in forward machine travel, while pulling it rearward reverses the machine.

Simply tilt the joystick to the left to make a left turn. Tilt it to the right for a right turn.

The travel speed is selected by pressing the shift button on the palm lever.

(D31/D37/D39-22, D61, D65EX/PX/WX, D85EX/PX, D155AX-6, D275, D375A, D475A, D475A SD and D575A SD)

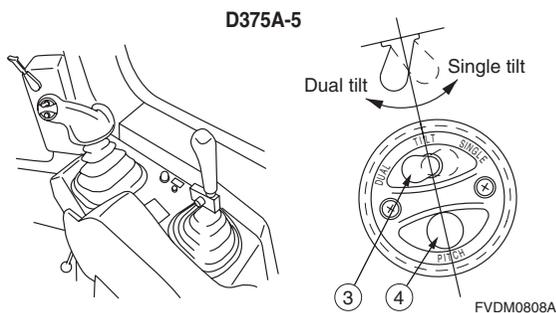

FVBH0229

Centralized oil pressure inspection ports

Oil pressure check ports are centralized on the left side of the chassis to make it easier to carry out inspection and maintenance.

Palm Command PPC Controlled Blade Control Joystick

Blade control joystick uses the PPC (Proportional Pressure Control) valve and palm command joystick the same as travel control joystick. PPC control uses the highly reliable Komatsu hydraulic system enabling superb fine control. (Dual tilt and pitch operation are enabled by depressing switch with a thumb. This is available when optional dual tilt dozer is installed.) (D61, D65EX/PX, D85EX/PX, D155AX-6, D275, D375A, D475A, D475A SD and D575A SD)

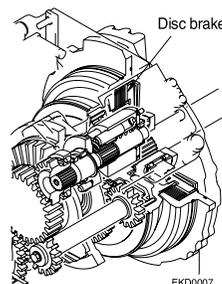

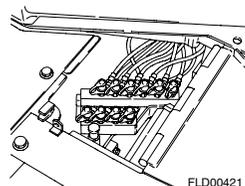

Easy maintenance

- Bolt-on type sprocket or segmented sprocket teeth for easy in- field replacement. [Except D21]
- Simple maintenance is promoted through adoption of spin-on type fuel and full-flow filters, an air cleaner with an automatic dust evacuator, and others.

Maintenance-free, wet, multiple-disc brakes

To ensure long life and dependability maintenance-free, wet, multiple-disc brakes are utilized. (D61, D65, D85, D155A-5/D155AX, D275, D375A, D475A and D575A)

KomStat Hydrostatic Transmission

3-speed HST

The D31/D37/D39-22 are equipped with Komatsu's exclusive KomStat Hydrostatic Transmission (HST) consists of dual-path and closed-circuit with two variable displacement piston pumps and two 3-speed variable displacement travel motors. The 3-speed variable capacity travel motors allow the operator to select the optimum speed to match specific jobs.

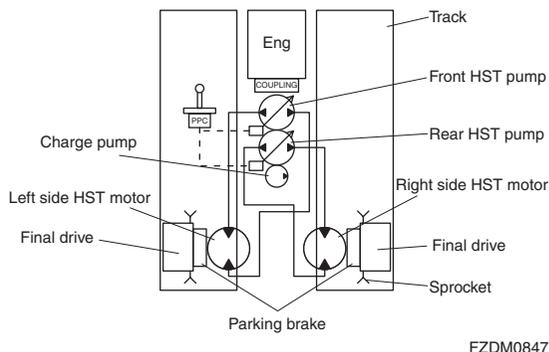

Automatic shift between 1st and 2nd speeds

KomStat shifts automatically between 1st and 2nd speed depending on load or ground conditions to facilitate efficient operation.

Intermediate speed selection

Enables the setting of intermediate speed in each speed range as operator desires or optimum travel speed to match job conditions.

This means, for example, intermediate speeds of 1st speed (4.3 km/h 2.7mph), such as 3.0 km/h 1.9 mph etc., are obtained by using the newly developed PPC valve with friction disc clutch. This contributes to increased job efficiency on fine or rough grading operation with optimum travel speed to match job conditions.

- **HST dynamic brakes**

KomStat uses HST dynamic brakes to ensure safe operation.

Parking brake is wet, multiple-disc type with a unique drag-prevention control to keep hydraulic oil clean.

(D31, D37 and D39)

- **K-Bogie undercarriage system**

K-Bogie undercarriage system retains prior advantages, with new additional features.

Features on K-Bogie Undercarriage System:

- K-bogies oscillate with two fulcrums, and track roller vertical travel is greatly increased. Impact loading on all undercarriage components has been reduced and durability of components is improved since track rollers are always in contact with track link.
- Undercarriage life is improved due to better control of track chain alignment with track rollers.
- Riding comfort is improved by reducing vibration and shock when traveling over rough terrain.
(D155AX-6, D275A, D275AX, D375A-6R and D475A)

- **Auto-shift down function**

Controller monitors engine speed, travel gear and travel speed.

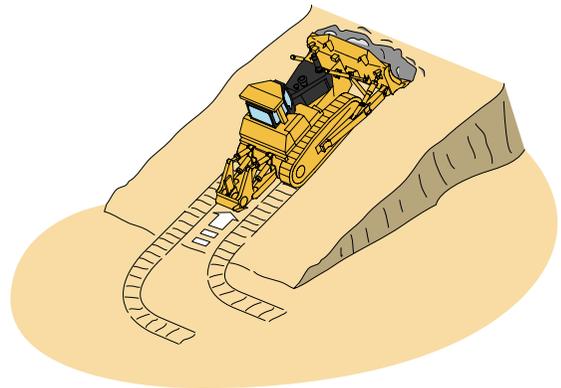

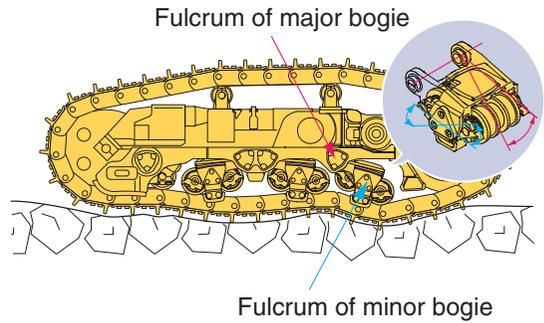

When load is applied and machine travel speed is reduced, the controller automatically downshifts to optimize gear speed to provide high fuel efficiency. This function provides comfortable operation and high productivity without manual downshifting. (This function can be deactivated with cancel switch).

(D275, D375A and D575A SD)

- **Preset travel speed selection function**

Preset travel speed selection function is standard equipment, enabling the operator to select fore and aft travel speed among three preset patterns, F1-R2, F2-R2 and manual shift. When F1-R2 or F2-R2 preset pattern is selected, and travel control joystick moves from forward to reverse direction, the machine travels forward/reverse with F1/R2 or F2/R2 speed automatically. This function reduces gear shifting time during repeated round trip operations.

(D275, D375A and D575A SD)

• **K-Bogie undercarriage system (8-roller, oscillating idler)**

New K-Bogie Undercarriage System combines prior advantages with new additional features.

Current features:

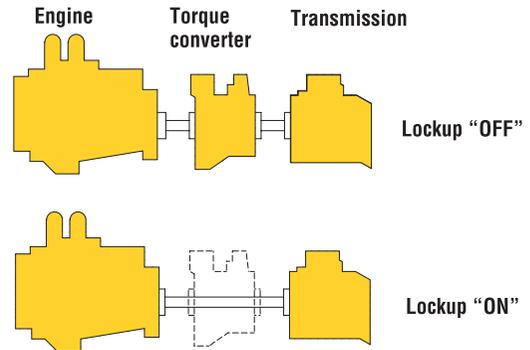

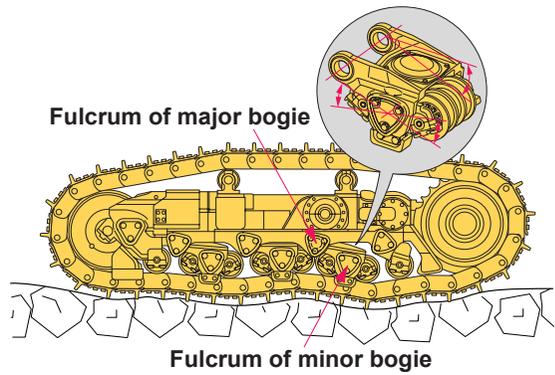

- K-Bogies that oscillate with two fulcrums assure large amount of track roller vertical. Impact load to undercarriage components is minimized and durability of components is improved since track rollers are always in contact with track link.
- Track rollers follow track link movement to extend the undercarriage life.
- Excellent riding comfort is provided due to less vibration and shock when traveling over rough terrain.

Features on new K-Bogie undercarriage system:

- New K-Bogies with front and rear single bogies are utilized providing increased length of track on ground to improve machine stability.
- The oscillating idler and increased sprocket lead angle improve riding comfort when traveling over rough terrain. (D375A-6, D475A-5E0 and D475ASD-5E0)

• **Automatic transmission with lockup torque converter**

A sharp reduction in fuel consumption and greater power train efficiency is achieved by the new automatic gearshift transmission and lock up torque converter. The automatic gearshift transmission selects the optimal gear range depending on the working conditions and load placed on the machine. The means the machine is always operating at maximum efficiency. (Manual gearshift mode is selectable with a switch) (D155AX-6)

■ Ecology Features

- **ecot 3 (EPA Tier 3, EU Stage 3A certified engine)**

Komatsu develops and produces all major components, such as engines, electronics and hydraulic components in house.

With this “Komatsu Technology”, and adding customer feedback, Komatsu is achieving great advancements in technology.

To achieve high levels of productivity and ecology, Komatsu developed the main components with an advanced control system.

The result is a new generation of high performance and environment friendly machines.

- **Fuel efficient electronic controlled engine**

The engine is EPA Tier 3 and EU Stage 3A emission regulation certified. The engine is turbocharged and features Common Rail Injection system (CRI) and air-to-air aftercooling to maximize power, fuel efficiency and emission compliance.

To minimize noise and vibration, the engine is mounted to the main frame with rubber cushions.

- **Hydraulic drive radiator cooling fan**

The engine cooling fan rotation speed is electronically controlled. The fan rotation speed depends on engine coolant and hydraulic oil temperatures, the higher the temperature the higher the fan speed. This system increases fuel efficiency, reduces the operating noise levels and requires less horsepower than belt driven fan.

(D61-15E0, D65-16, D85-15E0, D155AX-6, D275AX-5E0, D375A-6)

* : Standard shoe

** : See the classification of shoe application

Classification of the applications:

Classification	Applicable terrain	Limitations
A	Rocky terrain, general terrain	These can be used over a wide range of general civil engineering work from crushed rock to preparation of residential land. There is no particular limitation on their use.
B	General or soft terrain	These are used for general earthmoving work where the main work is scraping operations and pushing operations when constructing golf courses, and overburden stripping operations in coal mines. They cannot be used on rocky ground. Be careful to avoid traveling over rocks when carrying out operations on job sites where there are scattered rocks.
C	Extremely soft terrain (swamps)	These are used on soft ground where B classification shoes would sink. These cannot be used on ground where there are scattered rocks.

NOTE: Select the proper shoe width for your customers, by taking the limitations described above into consideration, (especially on wide shoes "B" and "C").
Select the narrowest possible shoes, depending on the flotation and ground pressure of the machines. If the shoe is too wide, the load on the track shoe increases and results in bends in the shoes, cracks in the links, breakage and slipping out of the pins and loosening of the bolts.

Applications of different shoes in accordance with soil characteristics and working conditions.

Type of shoe	Applicable soil and work	Advantages	Disadvantages	Remarks
1 Single grouser shoe 	General soil excluding rocky ground (for bulldozer)	<ul style="list-style-type: none"> Because the shape of the grouser is sharp, it easily bites into the ground and provides a large traction force. 	<ul style="list-style-type: none"> Strength is somewhat reduced on rocky ground, and bending and other damage may occur. The riding conform is a little inferior to the triple and double grouser shoes. The road surface is liable to be roughed. The turning resistance is large. 	Is available in various widths to suit the softness of the soil.
2 Heavy duty shoe 	For rocky ground (for bulldozer)	<ul style="list-style-type: none"> Compared to a single grouser shoe, the grouser and plate portions of this shoe are thicker and stronger, providing high bending resistance and wear resistance. 		
3 • Tripple grouser shoe • Double grouser shoe 	Hard ground Suitable for both soft and hard ground (for hydraulic excavator and dozer shovel)	<ul style="list-style-type: none"> The three grousers have the same height, hence turning ability is good. Good riding comfort is obtained as compared with a single grouser shoe. Rotating resistance is low. Because three beams are used, resistance to bending is high. 	<ul style="list-style-type: none"> This shoe does not readily bite into the ground, so the traction force is low. 	
4 Swamp shoe 	Swamp areas (for swamp dozer)	<ul style="list-style-type: none"> Because the cross-section of this shoe is an arc, the ground contact area is large, and buoyancy is easily obtained. This shoe is particularly suitable for use in swamp areas and areas with low ground pressure. The ground surface is not damaged when the machine travels over it, so it is suitable for soil compaction and leveling work. 	<ul style="list-style-type: none"> Unsuitable for ground other than swampy ground. When used off swampy ground, it is liable to bend due to its low strength. 	Various widths are available to suit the degree of softness of the swampy ground.
5 Snow shoe 	On snow	<ul style="list-style-type: none"> For use on snow To prevent transverse slip <ol style="list-style-type: none"> 1) Is provided with rib. 2) Grousers are stepped. For discharging ice and snow <ol style="list-style-type: none"> 1) Holes are provided in plate portion. 2) Tail of plate has been eliminated. 	<ul style="list-style-type: none"> Wear and damage occur rapidly when this shoe is used on general soil and rocky ground. 	
6 Flat shoe 	Paved roads Indoor work	<ul style="list-style-type: none"> Projections have been eliminated (heads of shoe bolts are recessed), permitting work on paved roads without damaging road surface. Turning resistance is very low, and tracks are highly wear resistant. 	<ul style="list-style-type: none"> Because there are no grousers, this shoe does not bite into the ground. 	

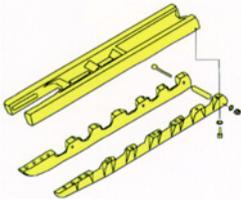

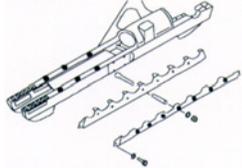

Type of shoe	Applicable soil and work	Advantages	Disadvantages	Remarks
<p>7 Road liner (rubber)</p> 	<p>Paved road Indoor work</p>	<ul style="list-style-type: none"> • The surface of the shoe in contact with the ground is made of rubber, so the machine can travel on paved roads without damaging the road surface. • Prevents noise when machine is traveling. 	<ul style="list-style-type: none"> • Use in the following places will shorten the cutting life of the rubber. <ol style="list-style-type: none"> (1) Rocky ground (2) Cold areas (below -25°C) (3) Hot areas (above 65°C) • Because there are no grouser, this shoe does not bite into the ground. 	
<p>8 Center hole shoe</p> 	<p>Soil which clogs</p>	<ul style="list-style-type: none"> • There is a hole in the plate to remove any mud or soil. • The sprocket removes any mud or soil collected between the track rails, so clogging of the track is reduced. 	<ul style="list-style-type: none"> • Strength is somewhat reduced on rocky ground, and crack and other damage may occur. 	

Roller guard installation (Bulldozer)

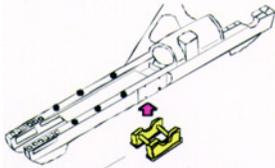

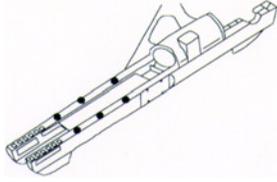

■ Small-middle Class

When using bulldozers, it is necessary to make most appropriate choices of the track roller guards fitting to respective working environments. Given below are the criterion for the choices.

This chart provides clearer criterion for the choices in consideration of respective functions of different types of track roller guards.

Types	Full roller guard	
	Integral structure full roller guard	3-part split type full roller guard
Determination criterion for different working environments		 Local add-on type
	Rocks and soil containing boulders and gravel (A and E)	The part is effective for prevention of catching pebbles.
	Sand and sandy soil (A, E and P)	The part is effective for prevention of pitch squeaking.
	Clayey soil (P and PL)	Be careful when using this part since the soil sets when dried. (Note 1)
	Swamp (PL and PLL)	The part is effective for prevention of snaking of the track. (Prevents side sliding of the track shoes.) (Note 1) The part is effective for prevention of disengagement of the track shoes.
	Slopes	The part is effective for prevention of disengagement of the track shoes. (Prevents side-sliding of the track shoes.)

(Note 1) Although soil and sand tend to enter less, once they enter, they may not be easily discharged depending on the type of soil, so make the choice in consideration of past experience with machines having been used in the subject area and of the working environments of the machine.

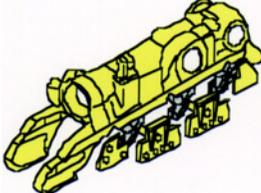

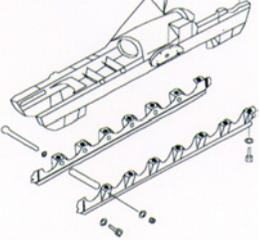

Types	Not full roller guard		
	Center and end section track guard	End section track guard	
Determination criterion for different working environments	 Short length guard for installation at the center section		
	Rocks and soil containing boulders and gravel (A and E)	The part is not suitable	The part is not suitable
	Sand and sandy soil (A, E and P)	No noticeable difference from use of the end-section only track guard	Although sand and soil tend to enter more, they can be easily discharged and this part is being employed.
	Clayey soil (P and PL)	The part is effective for prevention of disengagement or side-sliding of the track shoes	
	Swamp (PL and PLL)		
	Slopes	The part is not suitable	The part is not suitable

NOTE: Please consult your local distributor for availability of track rollers guard for the model that you require.

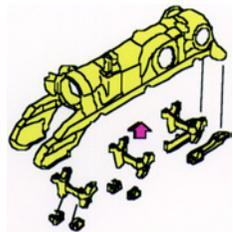

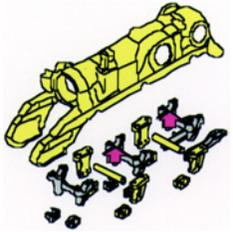

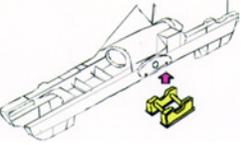

■ Large Class

When using bulldozers, it is necessary to make most appropriate choices of the track roller guards fitting to respective working environments. Given below are the criterion for the choices.

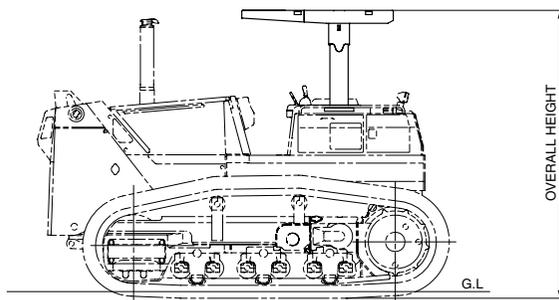

This chart provides clearer criterion for the choices in consideration of respective functions of different types of track roller guards.

Determination criterion for different working environments	Types	Full roller guard	
		Bogie full roller guard	Split type full roller guard
			
Rocks and soil containing boulders and gravel (A and E)	The part is effective for prevention of catching pebbles.		
Sand and sandy soil (A, E and P)	The part is effective for prevention of pitch squeaking.		
Clayey soil (A, E and P)	Be careful when using this part since the soil sets when dried. (Note 1)		
Slopes	The part is effective for prevention of disengagement of the track shoes. (Prevents side-sliding of the track shoes.)		

(Note 1) Although soil and sand tend to enter less, once they enter, they may not be easily discharged depending on the type of soil, so make the choice in consideration of past experience with machines having been used in the subject area and of the working environments of the machine.

Determination criterion for different working environments	Types	Not full roller guard		
		Bogie roller guard	Add-on full roller guard	Center end section track guard
				
Rocks and soil containing boulders and gravel (A and E)	Although sand and soil tend to enter more, they can be easily discharged and this part is being employed.	The part prevents stones from entering between rollers on the rocky soil	The part is not suitable	
Sand and sandy soil (A, E and P)	The part is effective for prevention of disengagement or side-sliding of the track shoes.		Although sand and soil tend to enter more, they can be easily discharged and this part is being employed.	
Clayey soil (A, E and P)			The part is effective for prevention of disengagement or side-sliding of the track shoes.	
Slopes	The part is not suitable		The part is not suitable	

NOTE: Please consult your local distributor for availability of track rollers guard for the model that you require.

CONTENTS

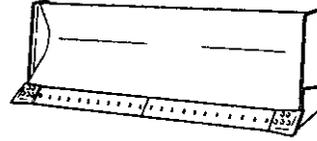

Blade Selection 1B-2
Blade Availability 1B-4
Blade Specifications:
 Straight-tiltdozer 1B-6
 Power-tilt power-pitch dozer 1B-7
 Angle dozer 1B-8
 Power Angle-tiltdozer 1B-10
 Semi-U-tiltdozer 1B-13
 Dual semi-U-tiltdozer 1B-15
 SIGMADOZER, Sigma power-pitch dozer 1B-16
 U-tiltdozer 1B-18
 Super Dozer 1B-21
 Coal Dozer 1B-22
Production 1B-23

Straight-tilt dozer

Having a high HP/ cutting edge length, this blade has an aggressive penetration. This blade also has a high HP/loose cubic yards for easy handling of heavy materials. The tilting function of this blade increases production and versatility. With a sturdy construction, this blade is suitable for powerful cutting and dozing, especially heavy cutting on rocky ground.

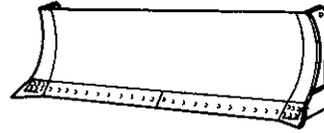

**Straight dozer**

This blade has the same structure and functions but is not equipped with a tilt-cylinder.

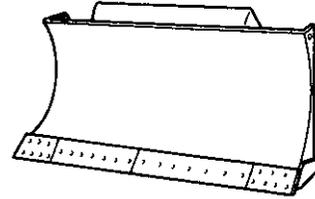

**Angle dozer**

The blade can be set straight or angled to both sides. Plowing earth or snow to one side is possible by angling the blade.

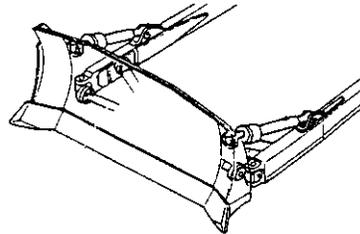

Useful for road construction, back filling etc.

**Power angle-tilt dozer**

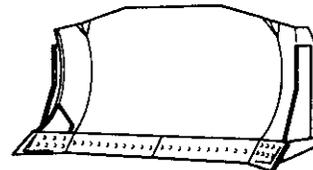

Power angling and tilting of the blade are possible from the operator seat. This blade is applicable for versatile works such as grading, back filling, spreading and light land clearing

**Dual tilt dozer**

The blade has two tilt cylinders on both sides. An optimum blade cutting angle for all types of materials and ground inclinations can be selected for increased loads and consequently increased production. A fast tilt speed and a large tilt angle also concentrate blade force where maximum penetration is needed.

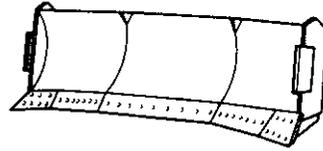

**Semi-U-tilt dozer**

The blade combines penetration ability of straight blade with increased load capacity provided by short wings which include only the end bits.

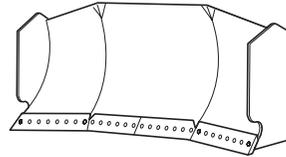

U-tiltadozer

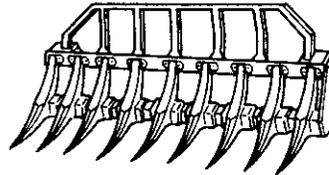

The wings on this blade minimize material spillage. Since this blade has a lower HP/loose cubic yards than a straight-tiltadozer, this blade is suitable for moving lighter or loose materials over long distances. Suitable works are land reclamation, stockpiling and other similar jobs.

**Coal dozer**

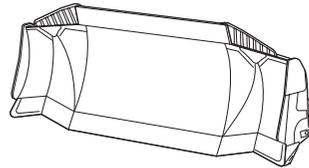

Specialized blade for pushing coal, with larger width and deep angled wings.

**Rake dozer**

Having teeth, this blade provides good penetration into the soil for removal of stumps, roots and rocks.

**SIGMADOZER**

A new frontal design concept adopted for digging and rolling up at the center of the blade increases soil holding capacity, simultaneously reducing sideway spillage. Reduced digging resistance produces smoother flow of earth, enabling the dozing of large quantities of soil with less power.

The estimated production curves give maximum production before correction and are based on the following conditions.

1. 100% efficiency
2. 0.05 min time fixed (for gear shifting)
3. Machine cuts for 15 m (50 ft), then drifts blade load.
4. Gear

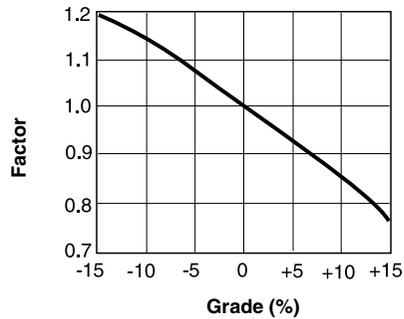

Machines with F3/R3	Machines with F4/R4
Cut : F1	Cut : F1
Carry : F2	Carry : F2, F3
Return : R2	Return : R3

$$\text{Actual Production} = (\text{Estimated Production}) \times (\text{Blade Factor}) \times (\text{Job Efficiency}) \times (\text{Grade Factor})$$

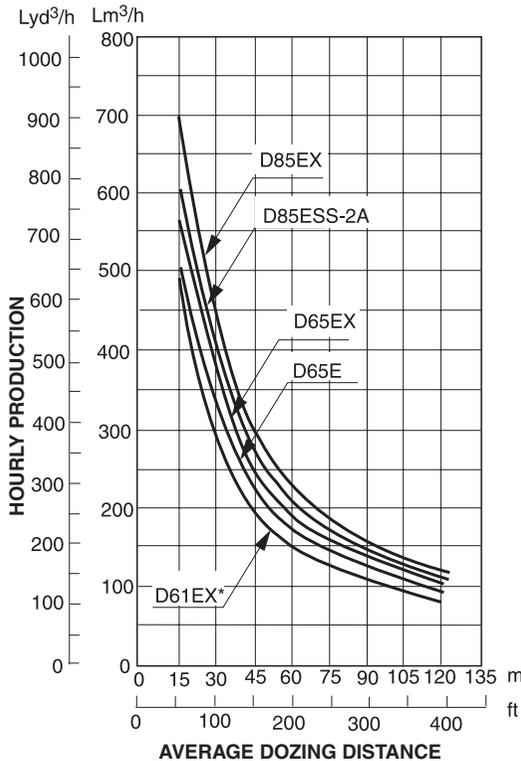

Correction Factor

BLADE FACTOR	
• Easy	1.1~0.9
• Average	0.9~0.7
• Rather difficult	0.7~0.6
• Difficult	0.6~0.4
JOB EFFICIENCY	
• Good	0.83 (50 min out of an hour machine use)
• Average	0.75 (45 min out of an hour machine use)
• Rather poor	0.67 (40 min out of an hour machine use)
• Poor	0.58 (35 min out of an hour machine use)

SECTION **1C**

RIPPERS

CONTENTS

Features 1C-2

Specification:

- Multi-shank Ripper (Rigid type) 1C-3**
- Multi-shank Ripper (Variable type) 1C-4**
- Giant Ripper (Variable type) 1C-5**

Ripper Selection 1C-7

Ripper Point Selection 1C-8

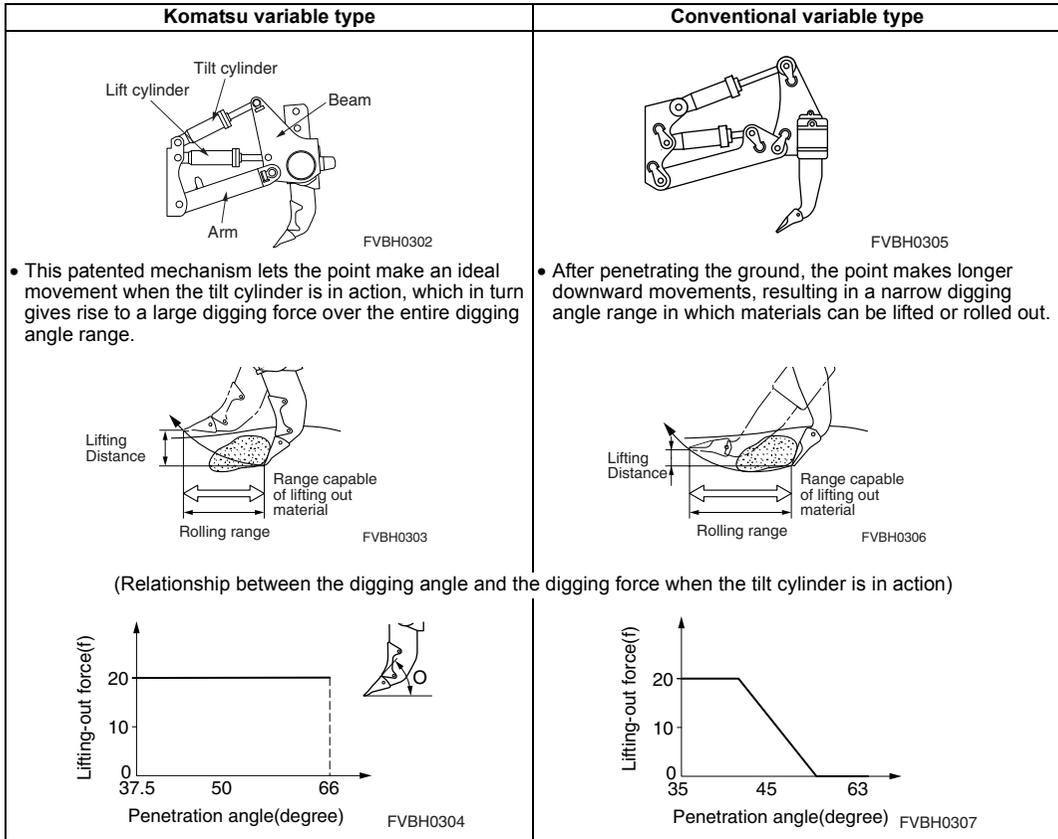

Production 1C-11

■ Outstanding productivity

1. Superior ripping performance is achieved through a large operating weight, high engine output and a conventional drive undercarriage.
2. Large maximum penetration depth provides high ripper production.
3. The unique linkage design enables the ripper point to draw an ideal locus during cylinder tilting for effective excavation of embedded rocks.

In the KOMATSU linkage, the lift cylinder is mounted on the beam, causing the point to make an ideal movement when the tilt cylinder is actuated.

Thus, the range of digging angles practically available is wider than the conventional type range, giving excellent digging force.

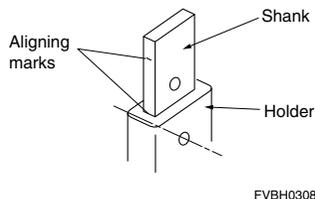

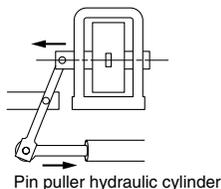

■ Minimum downtime

1. Large sectional area of the beam extends service life.
2. The forged ripper points are sharpened for excellent penetration and long service life.

■ Easy operation

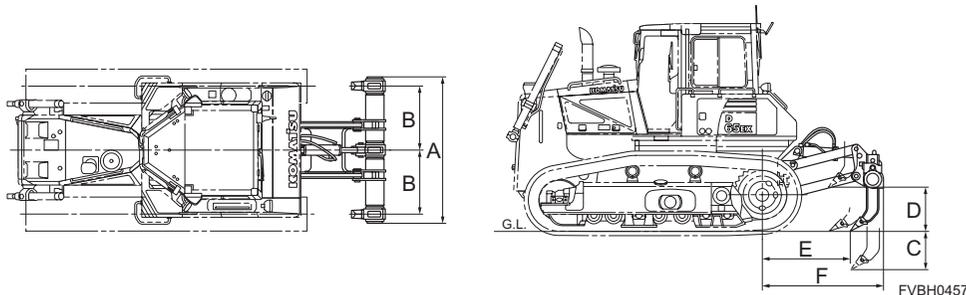

1. Optional pin puller facilitates change in digging depth.

The optional pin puller mechanism functions to insert or remove the pin from its hole. This is accomplished with a hydraulic cylinder and can be accomplished by an experienced operator, from within the cab. This feature thus provides a time savings benefit.

Multi-shank rippers (Rigid type)

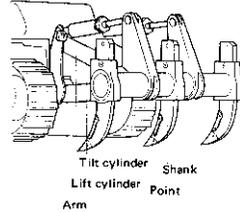

Highly efficient ripping of soft rock is possible with three shanks. The parallelogram ripper linkage maintains the shanks at the optimum digging angle during operation, regardless of the shank's penetrating depth.

Multi-shank rippers (Variable type)

The ripper point angle can be varied hydraulically to suit the specific ground conditions.

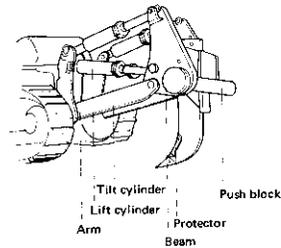

The ideal movement of ripper points ensures powerful digging force throughout the entire digging angle range.

Giant rippers (Variable type)

Specially made to handle hard rock with reinforced beam and a shank.

The tilt angle of the ripper point is adjustable for better penetration and fragmentation.

1. COMPARISON BETWEEN THE MULTI-SHANK AND GIANT (SINGLE SHANK) RIPPERS

Multi-shank Ripper		Giant Ripper	
M-1	Three tips provide high efficiency ripping of soft rock.	G-1	Sturdy construction. Suitable for harder rocks.
M-2	Foot of cliffs or slopes can be ripped by using the left or right tip.	G-2	Push plate allows tandem ripping.
<p>L: Giant l: Multi-Shank</p> <p>FVBH0310</p>		<p>FVBH0311</p>	
M-3	Adaptable to hard or soft rock by increasing or decreasing the number of shanks.	G-3	Deep penetration and large distance from shank to rear of bulldozer make it possible to handle large rocks.
		G-4	Pin puller simplifies changing shank length.

2. COMPARISON BETWEEN THE RIGID AND VARIABLE TYPE RIPPERS

Rigid type Ripper		Variable type Ripper	
F-1	Simple construction and low price.	V-1	Digging angle can be adjusted to obtain optimum conditions for type of rock and slope of ground.
F-2	Constant digging angle.	V-2	Digs out boulders easily.
F-3	Simple hydraulic circuit means fewer oil leaks.	V-3	Tilting function makes it possible to cut roots.

Various types of ripper points are available, and the general standards for selection according to the type of use are given below.

1. Types of ripper points

Ripper points are categorized according to the following three items.

Material	There are two main types: Heat-resistant type and high-toughness type. These are distinguished with a red mark and yellow mark, respectively.
Point length	There are two types: Long and short
Shape	There are two types: A symmetric type that can be turned and the non-symmetric type that cannot be turned.

When combining of these categories, 4~7 types of points are available for each model.

2. Features of each type of point

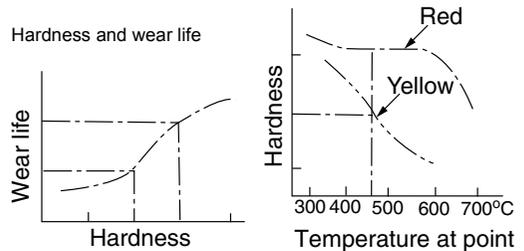

Red	Has high resistance to wear from generation of heat at the point tip, but compared with the yellow point, it lacks toughness.
Yellow	Compared with the red point, this has excellent toughness, but it has inferior wear life when heat is generated at the point.

If the point does not dig into the rock, but slips on the rock surface, the friction heat between the point and rock causes an extreme rise in temperature of the point, thus reducing point hardness.

There is a close relationship between hardness and wear: The higher the hardness, the less the wear.

Also there is a close relationship between increased temperature of the point and excellent wear of the point (abnormal wear).

The red point has superior heat resistance, it retains its hardness better than the yellow point as the temperature increases. Thus, the red point is advantageous for hard rock applications, which is where extreme point temperatures are typically seen. The trade off is that due to the higher hardness of the point, it is more brittle, and thus more susceptible.

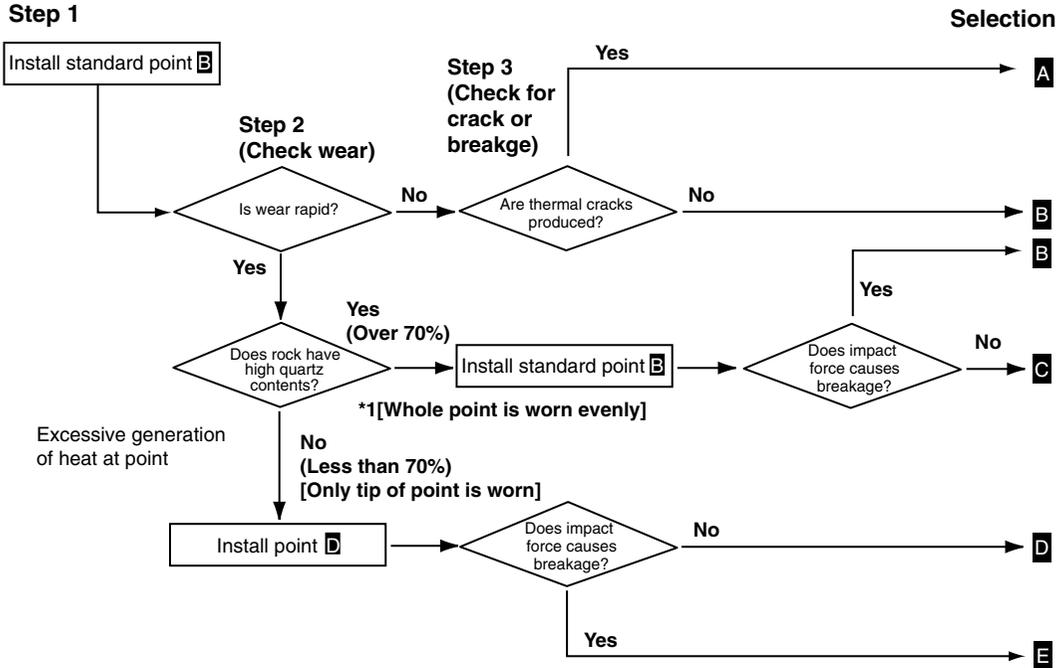

Long	Has a wear life 1.5 ~ 2.0 times greater than the short point, but its strength is inferior to the short point because of its extra length.
Short	Compared with the long point, it has superior strength, but has inferior wear life compare to the long point.
Non-symmetric type	<p>This has a self-sharpening shape, so it always retains its cutting edge, and provides a long life on jobsites where there is soft rock and penetration ability is not required. The rib provided only on the top surface wears gradually under the flow of the soil, and there is no change in the penetration surface pressure.</p> <p>$P = \frac{R1}{A \times B}$ $P =$ Penetration surface pressure $R1 =$ Input</p>
Symmetric type (can be turned)	<p>On hard rock where penetration ability is needed, it is possible to restore the penetration ability by turning the point.</p>

The table below gives a summary of the features of each type of point.

Length	Color	Shape	Seismic velocity	Wear tolerance	Strength, resistance to impact	Abnormal wear	Penetration	Cost	
Short	Yellow	Symmetric type	No particular limit	○	⊙	○	⊙	4	
		Non symmetric type					○		
	Red	Symmetric type			○	⊙	⊙		2
		Non symmetric type			○	○			
Long	Yellow	Non symmetric type	(As a guideline) Max. 1500m/sec		○	○	○	3	
	Red	Non symmetric type			△	⊙	○	1	

Key ⊙: Good, ○: Average, △: Poor
 Cost: 1 (Most expensive), 4 (Least expensive)

Procedure for selection

Selection	Typical rock			Suitable point	Shape	Availability				
	Hardness	Type of rock	Features			D85EX-1SR	D85EX-1SE0	D155AX-6	D275AX-5R	D275AX-5E0
A	Soft ↕ Hard	Shale, lime stone	<ul style="list-style-type: none"> Little quartz, little wear Deposited in layers, so ripping is easy 	Point for limestone <ul style="list-style-type: none"> Symmetric shape Yellow Short 				○	○	○
B	Soft ↕ Hard	All types of general rock	—	Standard point <ul style="list-style-type: none"> Symmetric shape Yellow Short 		○	○	○	○	○
C	Soft ↕ Medium	Sandstone	<ul style="list-style-type: none"> Proportion of quartz is extremely high (70%-95%), point wears rapidly 	Non-symmetric Shape <ul style="list-style-type: none"> Yellow Long 		○	○	○	○	○
D	Soft	Basalt andesite, granite, chert	<ul style="list-style-type: none"> Proportion of quartz is not so high (40%-70%) Rock is not composed of layers or seams, so heat is generated at point, point wears rapidly, ripping is difficult 	Non-Symmetric Shape <ul style="list-style-type: none"> Red Long 		○	○	○	○	○
E	Hard			Symmetric Shape <ul style="list-style-type: none"> Red Short 		○	○	○	○	○

* 1: When the point is worn uniformly, not only the tip of the point is worn, but also the thickness of the housing metal (place where shank enters) is also worn. On job sites where wear is rapid, it does not necessarily mean that the red point is suitable. There are many reasons why the point wears. Of these, rock hardness and the silica content are major causes. Therefore, even on soft rock, if there is a high silica content, there will be rapid wear of the point even though the temperature of the point does not rise greatly. As explained under the features of the red point, in such job sites, the advantages of the red point cannot be made use of. (On these job sites, there is no great difference in the wear life between the red and yellow points.)

Not all material can be ripped. Whether or not a rock can be ripped can be determined by any of the following methods:

- 1) By the type of rock
- 2) By an indoor rock test
- 3) By a field rock test
- 4) By a digging test with the ripper in the field.

Method 4) is most effective. If the user has no experience in ripping, an actual ripping operation should be demonstrated for the user by an operator experienced in ripping. Methods 1) and 3) are described below :

Determination of rippability by type of rock

Rocks are classified into sedimentary (aqueous), igneous, and metamorphic. The following general rules apply:

- 1) Sedimentary rocks such as sandstone, limestone, and shale can be ripped easily. Sedimentary rocks are usually found stratified in layers which vary in thickness. The thinner the layers, the easier it is to rip them.
- 2) Igneous rocks such as granite, basalt, and andesite are not found in distinct layers or cleavage planes, and this makes them difficult to rip.
- 3) Metamorphic rocks such as gneiss, schist, and quartzite vary in rippability according to the degree of stratification or cleavage.

Rippability depends not only on the type of rock, but also on the degree of weathering or fracturing.

Characteristics which determine the ease of rippability are summarized below.

• **Favorable rock for ripping**

- Stratified
- Weathered
- Brittle, crystalline nature
- High degree of laminations or thin layers.
- Fractured
- Faults or planes of weakness.

• **Unfavorable rock for ripping**

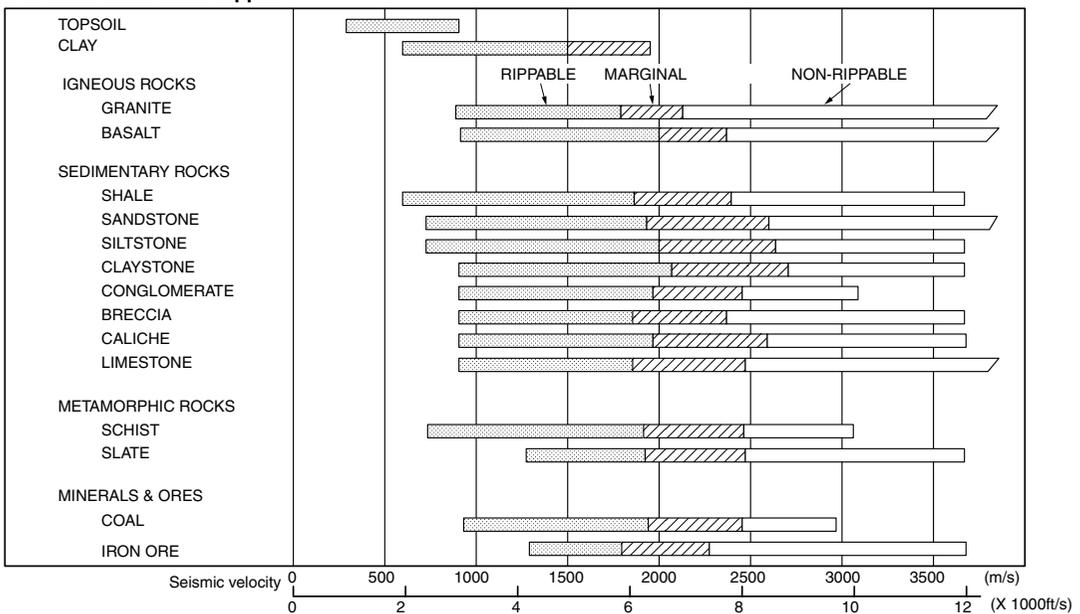

- Fine-grained with a solid cementing agent.
- Moisture, which tends to solidify the rock surface layer.
- Lacking planes of weakness
- Massive and homogeneous
- Non-crystalline and not brittle

Determination of rippability by in-the-field rock test.

Seismic wave velocity tests are used to estimate the rippability of rock. In this test, an artificial earthquake is introduced and the travel speeds of seismic waves through different kinds of sub-surface materials are measured. Thus the degree of consolidation, thickness of sub-surface layers, hardness, degree of fracturing, stratification, and weathering can be determined .

The chart below compares ripper performance to seismic velocities. It should be used **ONLY A ROUGH GUIDE**, because ripper performance is subject to many other conditions.

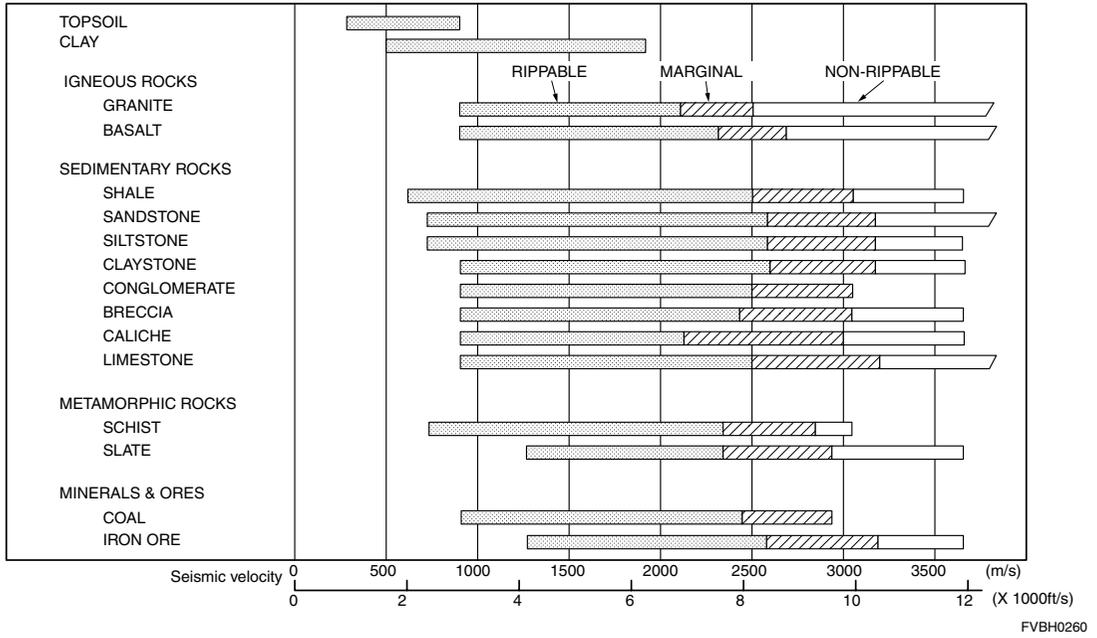

D155A/D155AX Giant Ripper

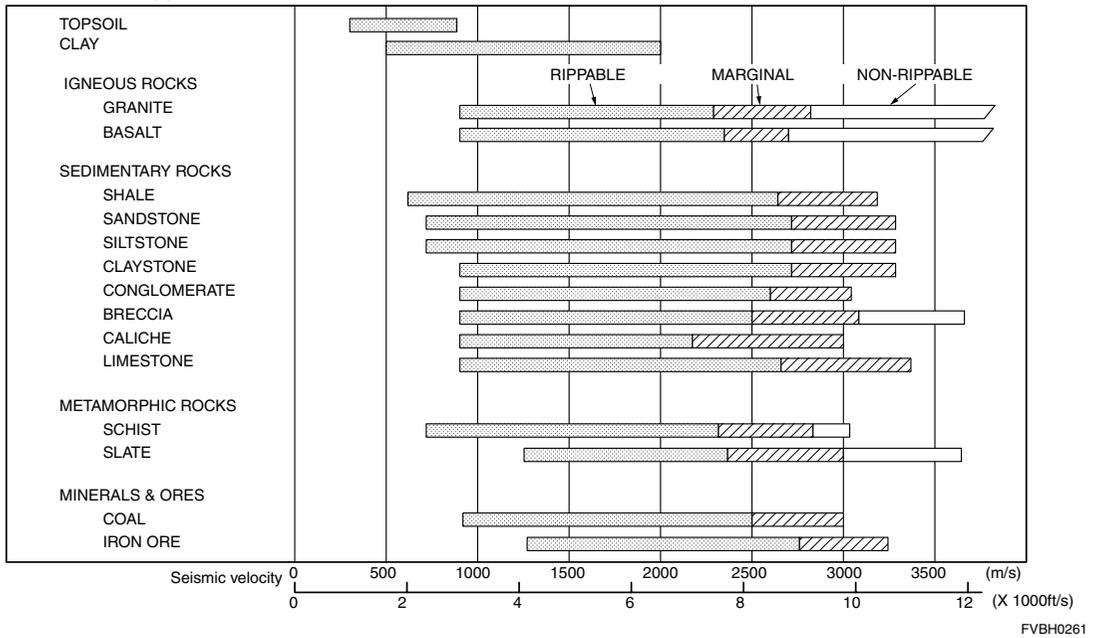

FVBH0259

The chart below compares ripper performance to seismic velocities. It should be used ONLY A ROUGH GUIDE, because ripper performance is subject to many other conditions.

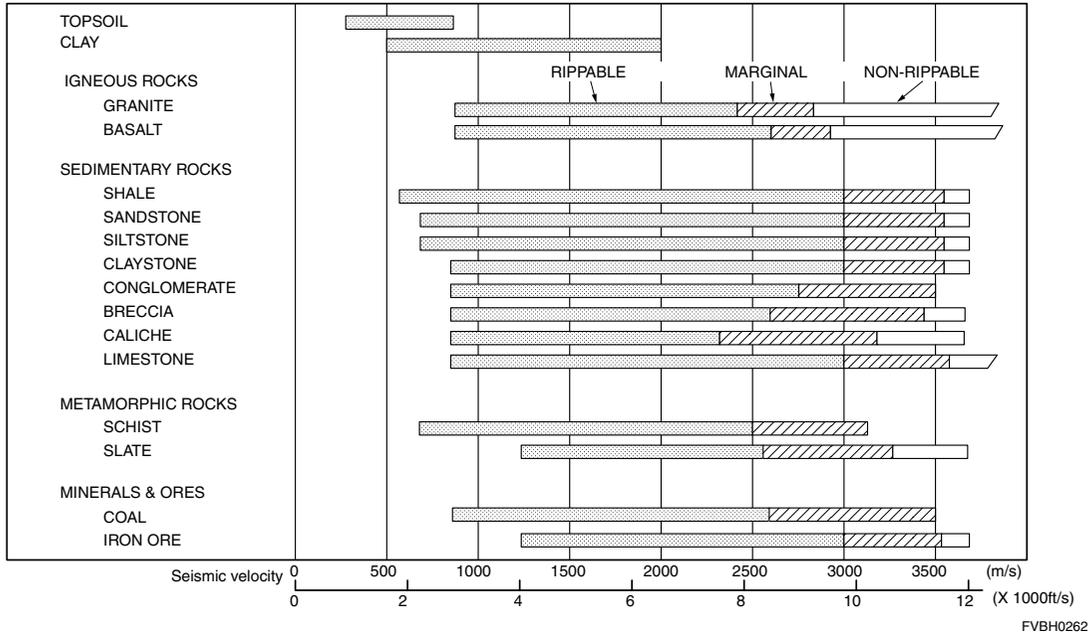

D275A / D275AX Giant Ripper

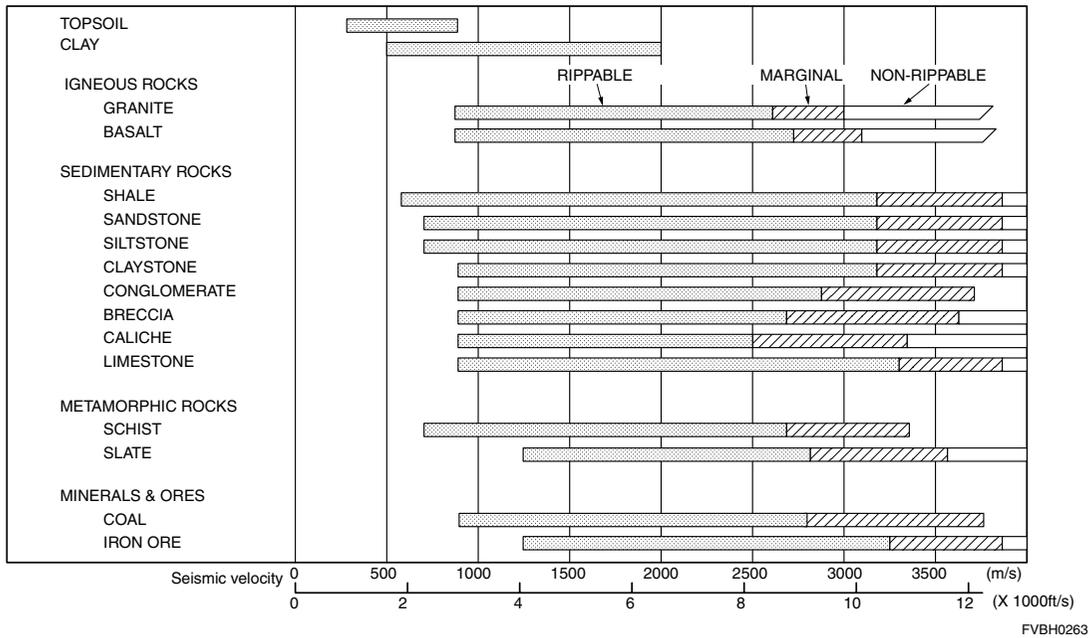

D375A Giant Ripper

D475A Giant Ripper

D575A Giant Ripper

Since ripper performance varies considerably with the characteristics of the rocks, the work methods, and operator's skill, it is impossible to estimate performance accurately. However, based on accumulated data, the relationship between seismic wave velocity and production can be ESTIMATED ROUGHLY as shown in the graph. This graph applies only to ripping operations. Production is given in bank.

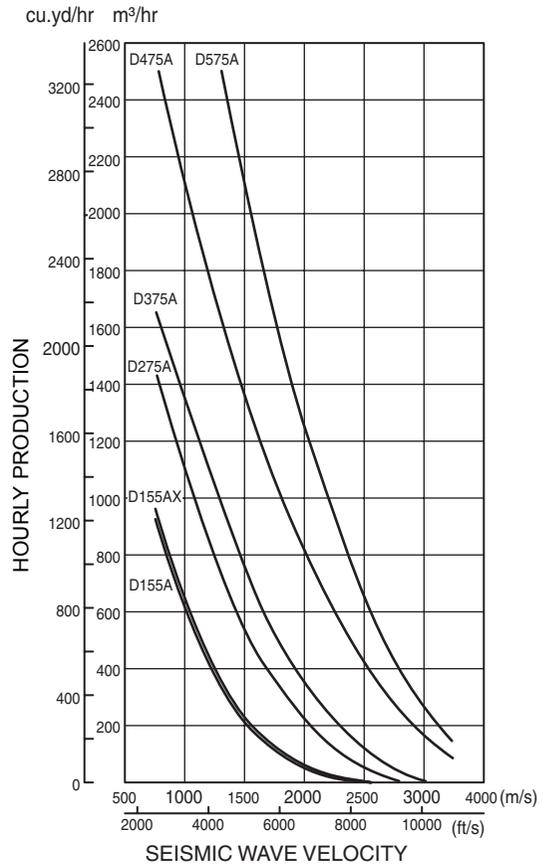

This graph is based on numerous field studies.

Actual production should be estimated as follows.

$$\text{Actual production} = (\text{Standard production}) \times (\text{Job efficiency})$$

Job Efficiency (E)

Operation conditions	E
Good (45 min out of an hour use)	0.75
Average (35 min out of an hour use)	0.58
Rather poor (30 min out of an hour use)	0.50
Poor (25 min out of an hour use)	0.40

FVBH0184

Conditions

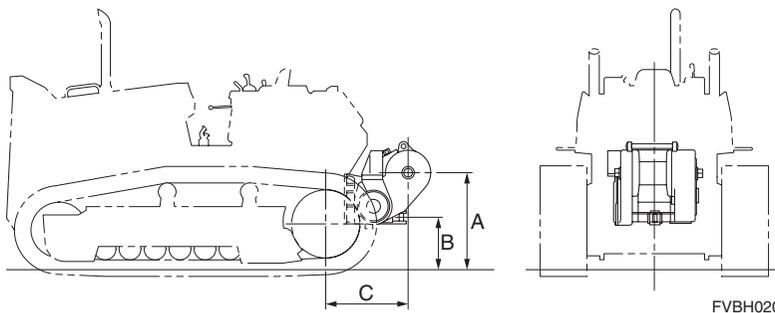

- 1) Ripping production only
- 2) Bulldozers with single shank rippers
- 3) 100% job efficiency

PIPELAYERS

CONTENTS

Features	1E-2
Specifications	1E-3
Lifting Capacity	1E-4

Faster, effortless winch control

- Komatsu pipelayers require only three levers for winch control, one each for the transmission, hook and boom.
- Choice of hook speeds for raising and lowering facilitates stringing, cradling and lowering in.

Big lifting capacity

- Komatsu pipelayers have the largest lifting capacity in their respective classes.
- Adjustment of the counterweights is made hydraulically and conveniently by a lever beside the operator's seat for machine balance.

Safe operation

- Komatsu pipelayers offer safety features to keep operators working confidently.
- All machines are standardly equipped with an automatic boom maximum stopper device.
- There is a free-fall setting on the hook control lever for use during an emergency.
- Komatsu pipelayers have a closed-type winch brake that prevents slips during operation in wet weather.
- Because the hook wires are located away from the operator, danger in the event of a wire cut is minimized.

Proven, stable undercarriage

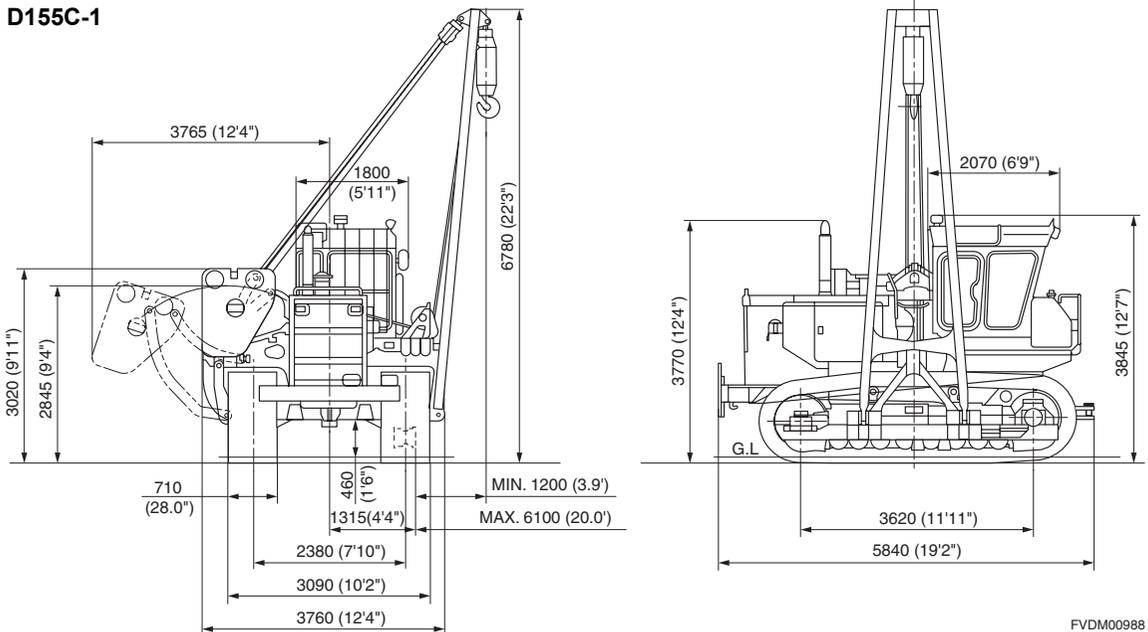

- Main components of these three machines are basically the same as those of the Komatsu D355A, D155A and D85A bulldozers. They have a proven record for reliable and durable performance, plus easy maintenance.
- A wide track gauge, large length of track on ground and counterweights give these pipelayers more stability to operate on steep slopes .

Trimming Operation in Vessel

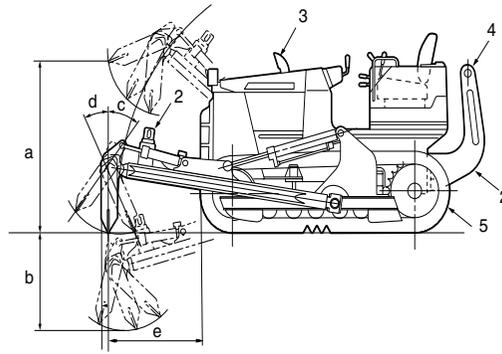

TRIMMING DOZERS

Unloading clamshell buckets and pneumatic unloader have been conventionally used to unload bulk cargoes (grain, salt, sugar, coal, ore fertilizer, chips, etc.) from vessels. However, the bucket scooping amount or suction decreases when the unloading work progresses, resulting in a corresponding deterioration of unloading efficiency.

This reduced efficiency means that vessels must remain longer in port, leading to a direct lowering of vessel operating efficiency and a substantial increase in port charges. Consequently, it has become necessary to find an effective method to facilitate bulk unloading. The conventional method is bulk cargoes were raked manually has been replaced by the bulldozer, and a trimming dozer has now been developed specifically for the handling of bulk cargoes in vessels.

Wheel loaders have often been employed at the final stages of unloading to protect the bottom of the vessel hold, however these have been replaced quite recently by trimming dozers equipped with rubber crawler.

(1) Trimming blade

Since the maximum lift (a), maximum drop (b), forward pitch angle (c) and backward pitch angle (d) of the blade are larger than usual and the breast dimension (e) is longer, substantially greater amounts of the bulk cargo can be raked and pushed at a time.

(2) Rear protector

Even if the trimming dozer inadvertently touches the hold frame, shoring, etc., the protector effectively prevents damage to the fuel and hydraulic oil tanks.

(3) Short exhaust pipe

A short exhaust pipe has been fitted to the trimming dozer to reduce overall height.

(4) Slinging hooks

The trimming dozer is provided with slinging hooks to enable it to be lowered into the hold.

(5) Track coming off prevention

Bulk cargo material caught between the tracks and sprocket is released through holes provided in the shoes, and this prevents the tracks from coming off.

(6) Dust preventive measures

Exhaust gas remains inside the hold, and dust resulting from the operation of the blade and the tracks accumulates both inside and outside the trimming dozer. To counter this problem, various measures have been taken.

1) Washable air cleaner inner element

Since the interior of the hold is extremely dusty, the air cleaner element becomes quickly clogged. However, as the inner elements are made of no-woven cloth or urethane and can therefore be washed, maintenance cost is greatly reduced.

2) Facilitation of washing

The trimming dozer requires washing on completion of one operation in readiness for the next to prevent deposits from the first operation being mixed in with the subsequent one. Hinges have therefore been adopted for the radiator grille and undercover to facilitate washing.

(7) Corrosion preventive measures

Bulk cargoes such as salt and potassium chloride corrode the terminals of electrical equipment, leading to short-circuiting. Thus, corrosion-proof alternators and starting motors have been adopted for the trimming dozers, and terminals are coated with silicone compound.

(8) Safety measures

Trimming dozers are equipped with backup buzzers and red color lights to provide ample warning when moving in reverse.

The trimming dozers destined for in-vessel cargo work are selected so as that other cargo handling unloaders and derricks may function with good efficiency.

When selection is made on the models of trimming dozer, the structure of holds (hatch size, existence of twin deck, frame conditions, etc.), capacity of unloader (lifting capacity and cargo volume), and cargo material to be handled must be taken into consideration.

(1) Lifting capacity of derricks, unloaders, etc.(weight and height)

The most important factors to be taken into consideration for selecting the trimming dozer model are that the weight of the trimming dozer should be less than the capacity of derricks and unloaders that take them down to vessel hold.

(2) Hourly production

When trimming dozers are thrown into vessel cargo work theater, they have to work in cooperation with other unloading machines and other hold dozers, etc. It is necessary to grasp previously the treating capacity of each dozer, in order not only to elaborate the entire work schedule but also to study the economical of the work.

(3) Hatch opening area

Generally, the opening of vessels, hatch has sufficient dimensions for letting trimming dozers in and out of the hold, but it is advisable to check its dimensions prior to proceeding to actual work.

(4) Selection of track shoe

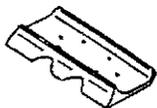

It is difficult to change the ground-pressure of the trimming dozer according to cargo to be handled. However, there exists a certain degree of adaptability to ground-pressure depending on the cargo. Therefore, it is recommended to take into consideration of the following table as a reference when selecting the shoe.

Ecology Features

ecot3 (EPA Tier 3, EU Stage 3A certified engine)

Komatsu develops and produces all major components, such as engines, electronics and hydraulic components in house.

With this “Komatsu Technology”, and adding customer feedback, Komatsu is achieving great advancements in technology.

To achieve high levels of productivity and ecology, Komatsu developed the main components with an advanced control system.

The result is a new generation of high performance and environment friendly machines.

Fuel efficient electronic controlled engine

The engine is EPA Tier 3 and EU Stage 3A emission regulation certified. The engine is turbocharged and features Common Rail Injection System (CRI) and air-to-air aftercooling to maximize power, fuel efficiency and emission compliance.

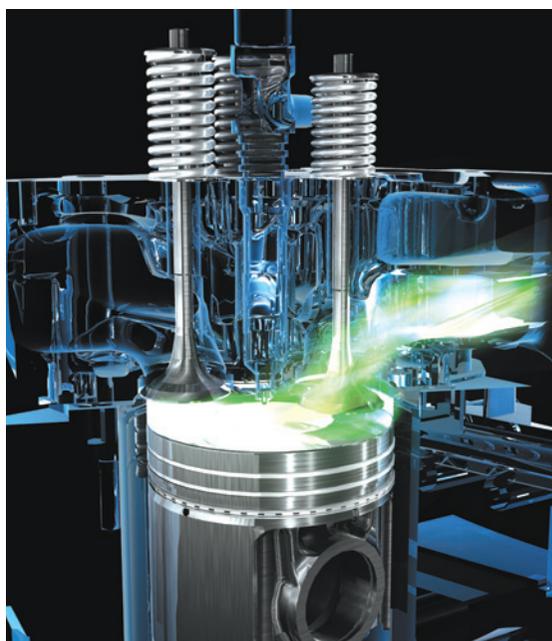

To minimize noise and vibration, the engine is mounted to the main frame with rubber cushions.

(PC130-8, PC160LC-8, PC200-8 – PC290-8, PC300-8 – PC450-8, PC600-8, PC800/850-8, PC1250-8)

Hydraulic drive radiator cooling fan

The engine cooling fan rotation speed is electronically controlled. The fan rotation speed depends on engine coolant and hydraulic oil temperatures, the higher the temperature the higher the fan speed. This system increases fuel efficiency, reduces the operating noise levels and requires less horsepower than belt driven fan.

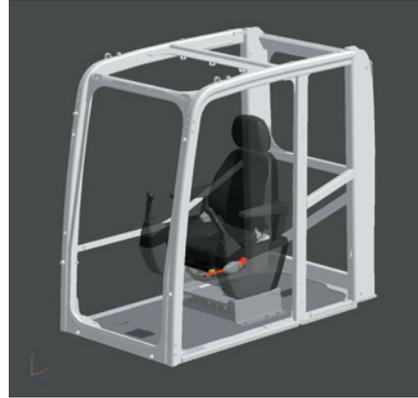

(PC600-8, PC800/850-8, PC1250-8)

Dash-8 series (PC130-8 – PC400-8)

Cab Dedicated to Hydraulic Excavator

The cab is designed specifically for hydraulic excavators' and gains reinforced strength from the pipe-structured cab framework. The cab frame work provides the high durability and impact resistance with very high impact absorbency. The seat belt keeps the operator is the safety of the cab during a rollover.

Large multi-lingual LCD Monitor

A large user-friendly color monitor enables safe, accurate and smooth work. Improved screen visibility is achieved by use of TFT liquid crystal display that can easily be read at various angles and lighting conditions. Simple and easy to operate switches. Industry first function keys facilitate multi-function operations.

Displays data in 10 languages to globally support operators around the world.

Indicators

- | | |
|----------------------------------|-----------------------------------|
| 1 Auto-decelerator | 5 Hydraulic oil temperature gauge |
| 2 Working mode | 6 Fuel gauge |
| 3 Travel speed | 7 Eco-gauge |
| 4 Engine water temperature gauge | 8 Function switches menu |

Basic operation switches

- | | |
|-------------------------|---------------------|
| 1 Auto-decelerator | 4 Buzzer cancel |
| 2 Working mode selector | 5 Wiper |
| 3 Traveling selector | 6 Windshield washer |

Eco-gauge that Assists Energy-saving Operations

Equipped with the Eco-gauge that can be recognized at glance on the right of the multi-monitor for environment-friendly energy-saving operations.

Allows focus on operation in the green range with reduced CO₂ emissions and efficient fuel consumption.

Idling Caution

To prevent unnecessary fuel consumption, an idling caution is displayed on the monitor, if the engine idles for 5 minutes or more.

Dash-7 Series

■ High production and low fuel consumption

• Working mode selection

Dash-7 excavators are equipped with three working modes (A, E and B mode).

Production is increased with larger output during Active mode while efficiency is further improved.

Working Mode	Application	Advantage
A	Active mode	<ul style="list-style-type: none"> • Maximum production/power • Fast cycle times
E	Economy mode	<ul style="list-style-type: none"> • Excellent fuel economy
B	Breaker operation	<ul style="list-style-type: none"> • Optimum engine rpm, hydraulic flow

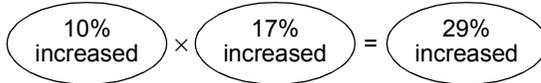

• Larger digging power provides increased production

Bucket digging force and bucket digging speed are increased, so resulting total bucket digging force increased.

(PC200-7, PC220-7)

Example: PC200-7

Bucket Digging Force Bucket Digging Speed Bucket Digging Power

• Larger arm crowd force and digging force provide increased production (PC300-7, PC600-7)

• Large lifting capacity

Lateral stability is improved resulting in increased lifting capacity.

• Larger maximum drawbar pull

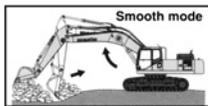

Maximum drawbar pull is increased, provides superb steering and slope climbing performance.

• Power max function

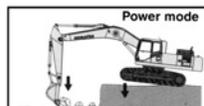

This function temporarily increases digging force by 7% for added power in tough situations.

• Two boom settings

Smooth mode provides easy operation for gathering blasted rock or scraping down operation. When maximum digging force is needed, switch to Power mode for more effective excavating. (PC300-7, PC800-7)

Boom floats upward, reducing lifting of machine front. This facilitates gathering blasted rock and scraping down operations.

Boom pushing force is increased, ditch digging and box digging operation on hard ground are improved.

■ Harmony with environment

• Low emission engine

Komatsu Dash-7 Series engine meets EPA, EU and Japan Tier II emissions regulations.

• Environment oriented mode (Economy mode)

Economy mode offers the user fuel savings, quiet operation and less CO₂ emission.

■ Large comfortable cab

• Large-sized cab

New cab volume is increased by 14%.

• Pressurized cab

With optional air conditioner, air filter and higher internal air pressure prevent external dust from entering the cab.

• Low noise

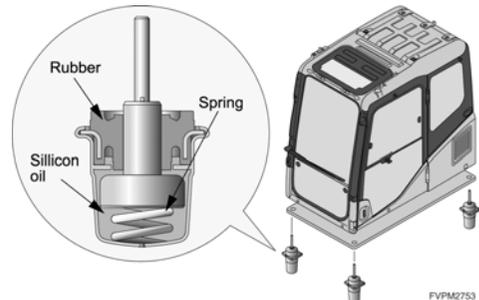

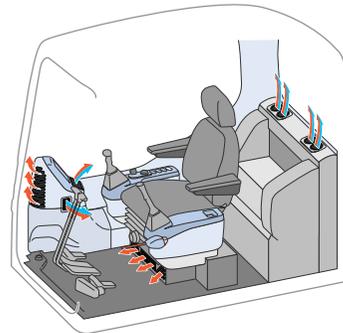

Noise is reduced not only from the engine but also during swing and hydraulic relief.

• Low vibration with cab damper mounting

The new cab damper mounting combined with strengthened left and right side decks aids vibration reduction at operator seat.

• Automatic air conditioner (Optional)

A 6,900 kcal (SAE) air conditioner is utilized.

FVPM2753

■ **Easy maintenance**

• **Hydraulic oil and filter/engine oil and filter replacement interval extended**

Oil and filter change interval

Item	Model	Dash-7	Avance series
Engine oil	h	500	250
Engine oil filter	h	500	250
Hydraulic oil	h	5000	5000
Hydraulic oil filter	h	1000	500

• **Easy radiator cleaning**

Clearance between radiator and oil cooler is increased to facilitate radiator core cleaning with an air nozzle.

• **Remote mounted engine oil filter and fuel drain valve for easy access**

• **Water separator is standard equipment**

• **Fuel tank capacity is increased**

• **SCSH bushings on work equipment extend lubricating interval from 100 hours to 500 hours (optional)**

■ **Multi-function color monitor (optional)**

• **Hydraulic pump oil flow adjustment system**

When installing attachments (breaker, crusher, etc.) and B, A, or E mode is selected, it is possible to adjust engine and hydraulic pump discharge flow to match attachment characteristics.

• **Lifting mode**

When the Lifting mode is selected, lifting capacity is increased by 7% by raising hydraulic pressure.

• **EMMS (Equipment Management Monitoring System)**

• **Monitor function**

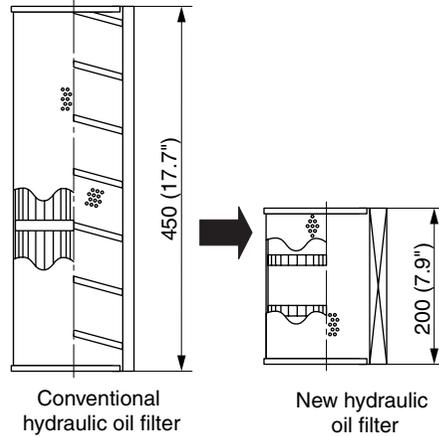

Controller monitors engine oil level, coolant level, engine oil pressure, coolant temperature, battery charge and air cleaner clogging, etc. If controller finds any abnormality, it is displayed on the LCD.

• **Maintenance function**

Monitor informs replacement time of oil and filters on LCD when the replacement interval is reached.

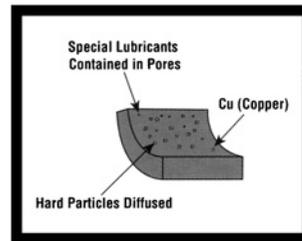

• **Trouble data memory function**

Monitor stores abnormalities for effective troubleshooting.

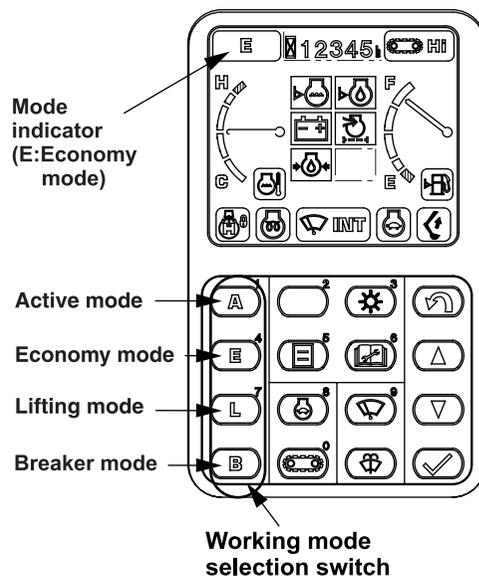

FZPM2775

SCSH Bushing

Deluxe spec monitor

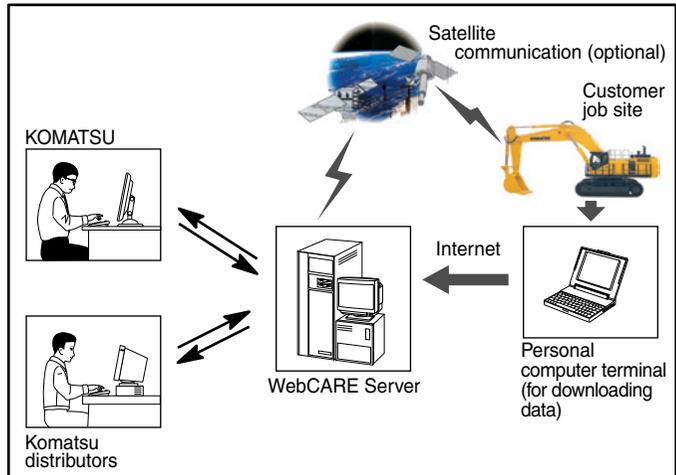

FZPM2902

VHMS (Vehicle Health Monitoring System)

VHMS controller monitors the health conditions of major components, enables remote analysis of the machine and its operation. This process is supported by the Komatsu distributors, factory and design team. This contributes to reduced repair costs and to maintaining maximum availability.

(PC1250-7, PC1250-8, PC2000-8)

■ Merits of Using VHMS

Diagnosis

- Machine health information that used to take approximately 1 hour to be measured can now be downloaded by personal computer in approximately 10 minutes, shortening the vehicle's down time.
- Furthermore, if the satellite communications function is equipped, the machine information can be gathered without stopping the vehicle at all. (Not available in some regions.)

Recommendation

- An appropriate recommendation can be made by viewing these data over the Internet.
 - Proper driving methods
 - Formulation of maintenance plans in advance that suit the customer's production schedule.

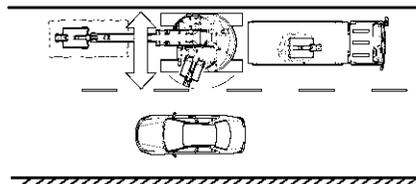

Customer's Benefit

- Sudden break down can be prevented through utilization of data trend (change over time).
- Ascertaining the facts and searching for the cause of the breakdown are simplified, thus enabling problems to be resolved quickly.
- Down time can be shortened by the systematic use of Reman components.
- Machine life can be extended significantly by proper operation and proper maintenance.

US-Series (Short tail. US stands for ultra tail and standard boom)

■ High productivity and safety

- **Short implement swing radius**
US series can work in areas where conventional profile excavators would pose a safety risk.
- **Short tail swing radius**
US series reduces the operator's need to check behind him for movement.
- **Wide working ranges**
Maximum digging height of the US series are larger than conventional machine.

Rubber Crawler Excavators

■ Komatsu rubber crawler excavators for low noise, low vibration and less damage

Compared to steel, rubber crawlers emit much less traveling noise and transmit far less vibration to the ground.

Rubber crawlers enable you to move your equipment smoothly and easily over short distances, without a carrier. There's no need to lay any extra sheet over the road because rubber causes less damage to roads and other paved areas. In other words, rubber crawlers and pad shoes are safer for the environment, more comfortable for the operator and less disturbing to the neighborhood.

Smooth, quiet, damage-free machines are just what you need for reconstruction and redevelopment projects in busy streets and other urban areas.

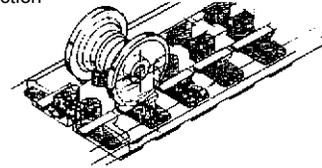

• Rubber crawlers for mini hydraulic excavator

When mini hydraulic excavators ride on durable rubber crawlers, they can accomplish an even wider variety of jobs smoothly, quietly and over all types of pavement, without damage to the urban environment.

In addition, large metallic base embedded in rubber assures extended crawler life.

The rubber crawler is securely held in position by two flanges of track rollers, minimizing the chance of crawler removal from the undercarriage and enabling stable traveling.

Strong, durable rubber crawler construction

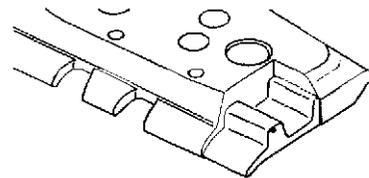

• Rubber pad shoes for medium-class hydraulic excavators

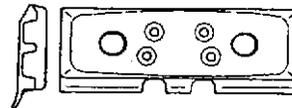

Rubber pad shoes provide the same strength as conventional tracks but with a smooth, quiet and gentle grip.

A blend of natural and synthetic rubbers assures maximum strength. This durable, hard material is baked onto the metallic triple-grouser shoe. As a result, the total shoe assembly is as strong as conventional shoes.

To assure lower maintenance costs, each rubber pad shoe is bolted on the track link in the same manner as standard steel shoes. So, shoe plates are completely interchangeable and only damaged shoes need to be replaced. What's more, rubber pad shoes offer extended service life because even after the rubber pad wears out, these shoes are still usable as the flat or triple-grouser shoes.

Bolt-on pad rubber shoe

Komatsu Mining Shovel Features

High production with low running costs

High digging forces provide fast cycle times and low cost per tonnage

Environmental harmony

- Komatsu engines which meet EPA, EU and Japan emission regulations
- Extended oil change intervals and filter replacement intervals to reduce environmental impacts
- Long term experience in use of biological hydraulic oils and lubricants, as an option available

Large, comfortable and safe mining operator's cab

- Integrated FOPS structure according ISO 3449
- Internal floor area 4.2 m² (6510 sq.in)
- Large windows for good all around visibility
- Side sliding windows
- Pressurized to keep dust out
- Noise level in cab approx. 76 dB(A) according ISO 63096
- High intensive XENON working lights.
- Cab heating and air conditioner of 10 kW
- Comfortable multi-functional operator seat with internal heating
- Second swing out fold away seat for trainer
- Wash-hand basin
- Refrigerator

ECS or VHMS monitoring system for greater machine efficiency and low maintenance time

- Comprehensive overview of shovel functions with operator friendly display
- Optional data transfer possibility via Modular Mining System controller
- All important machine running datas are monitored and electronically stored, with down load facility
- Acoustic and visually alarms warn of machine malfunctions

Komatsu Engine

- Latest engine technology compliant with emission regulations
- Engine life time self cleaning stainless steel engine oil filter (ELIMINATOR) to avoid filter change; only filter cleaning at every 1000 hour is required
- Engine oil management system (Reserve and Centinel system) to extend oil change intervals up to 4000 hours
- Fuel tank capacity for continuous work up to 24 hours

Electric drive as option

- Electric motor 6600/7200 V and 50 or 60 Hz available
- Squirrel cage motor with soft start
- Optimized electrical design for all international standards
- Compact design with low vibration and noise
- Cable drum with automatic tensioning, as option

Komatsu hydraulic system HYDRO-PILOT

- Multi-circuit hydraulic system with electronic load governor, pump flow summation capability, and oil flow priority based on demand, for fast working cycles and high productivity
- All main hydraulic circuits are run at one pressure level only, simplifying pressure adjustment and service
- Each circuit with connection facility for pressure check gauges
- Changing from front shovel to backhoe is simple
- Un-pressurized hydraulic tank with large pump suction lines and low pump speed prevents risk of cavitation
- Each hydraulic circuit protected with high pressure filters
- Full flow 10 µm return line filters for system safety and for supplementary circuits 3 µm by-pass filter to improve oil quality for long component lifetime
- Swing out hydraulic cooler for simple cleaning to keep the cooling efficiency

Heavy-duty shovel undercarriage design

- Komatsu Mining Germany track system with oscillating shoes for optimum response to rugged mining ground conditions
- Lifetime lubricated rollers
- Automatic track tensioning system
- Track shoes in high quality casting steel and engineered by finite element method
- Precision hard facing of contact surfaces for long term performance
- Different width of shoes available for best performance in softer mining ground conditions

Attachments

- Backhoe attachment available for all mining applications
- Closed box design combining steel plates and castings, engineered by finite element method for full lifetime
- Wide selection of buckets and customized options
- Bucket wear package ranges to meet all mining conditions
- Attachment pin sealing arrangement for reduced bearing wear-parts costs

Service

- Hydraulically assisted ladder for ease and convenience access
- Upper structure walkway allows safe access to all service points
- Walk in machinery house provides all weather protection for service attention
- Automatic central lubrication system for attachment and main swing bearing
- Swing down service arm for fast, ground level refilling and evacuation and the minimizing of leakages during service
- Complete machine delivered in pre-tested modules for fast erection on job side

Series Selection

You can choose the right machines for your work, factory-equipped for your operation.

- **"Dash-8" Series, "Dash-7" Series, AVANCE "Standard" Series**
Flexible, efficient excavators for a wider range of work
- **"Dash-8" Series, "Dash-7" Series**
"Heavy-duty" excavators with reinforced undercarriages for logging and scrap handling
- **AVANCE "US" Series**
Excavators with short tail swing profile for work on road ways, urban areas and logging road way

Applications of different shoes in accordance with soil characteristics and working conditions.

Type of shoe	Applicable soil and work	Advantages	Disadvantages	Remarks
<p>1 • Tripple grouser shoe</p>  <p>• Double grouser shoe</p> 	<p>Hard ground Suitable for both soft and hard ground</p>	<ul style="list-style-type: none"> • The three grousers have the same height, hence turning ability is good. • Good riding comfort is obtained as compared with a single grouser shoe. • Rotating resistance is low. • Because three beams are used, resistance to bending is high. 	<ul style="list-style-type: none"> • This shoe does not readily bite into the ground, so the traction force is low. 	
<p>2 Swamp shoe</p> 	<p>Swamp areas</p>	<ul style="list-style-type: none"> • Because the cross-section of this shoe is an arc, the ground contact area is large, and buoyancy is easily obtained. • This shoe is particularly suitable for use in swamp areas and areas with low ground pressure. The ground surface is not damaged when the machine travels over it, so it is suitable for soil compaction and leveling work. 	<ul style="list-style-type: none"> • Unsuitable for ground other than swampy ground. When used off swampy ground, it is liable to bend due to its low strength. 	
<p>3 • Road liner (rubber)</p>  <p>• Rubber pad</p> 	<p>Paved road Indoor work</p>	<ul style="list-style-type: none"> • The surface of the shoe in contact with the ground is made of rubber, so the machine can travel on paved roads without damaging the road surface. • Prevents noise when machine is traveling. 	<ul style="list-style-type: none"> • Use in the following places will shorten the cutting life of the rubber. <ol style="list-style-type: none"> (1) Rocky ground (2) Cold areas (below -25°C) (3) Hot areas (above 65°C) • Because there are no grouser, this shoe does not bite into the ground.

Classification of the applications:

Classification	Applicable terrain	Limitations
A	Rocky terrain, river banks, & general terrain	1. Use low gear for traveling over harsh terrain with various obstacles such as rolling stones and fallen trees.
B	General or soft terrain	1. Not applicable for traveling over harsh terrain with rolling stones and fallen trees. 2. Travel in high gear only on flat ground ; use half speed in low gear for going over the obstacles, if they are unavoidable.
C	Extremely soft terrain (swamps)	1. Applicable only when "A" & "B" sink. 2. Not applicable for traveling over harsh terrain with rolling stones and fallen trees. 3. Travel in high gear only on flat terrain ; use half speed in low gear for going over the obstacles if they are unavoidable.
D	Paved road	1. Rubber pad shoes must be used mainly in machine operation on paved road surfaces. If used on unpaved surfaces, shoe durability will be badly deteriorated due to rubber cracks, cutouts etc. The following operations must be avoided. (a) Work on broken concrete, gravel, etc. (b) Work on sharp projections like reinforcing iron rods, glass, etc. (c) Riding on concrete road shoulder, operation on bedrock and in rivers with abundance of stones, pebbles, etc. 2. In operation on roads covered with water, ice, snow, gravel etc. be careful to avoid the shoes slipping, especially in carrying or unloading operation of a machine on or from a truck. 3. In operation at high temperature (65°C or higher) or at low temp. (-25°C or lower), the rubber will be liable to damage because of the changes in the physical properties.

NOTE: Select the narrowest possible shoes, depending on the flotation and ground pressure of the machines. If the shoe is too wide, the load on the track shoe increases and results in bends in the shoes, cracks in the links, breakage and slipping out of the pins and loosening of the bolts.

Definition: Ground pressure = machine operating weight / total ground contact area
where ; total ground contact area = (L + 0.35H) × shoe width × 2

H = Track height
L = Distance between centers of sprocket and front idler

NOTE: The shoe for the long-track excavator (L and LC), wide shoe (excluding the narrowest shoe for a model) and swamp shoe are provided with low ground pressure. These shoes should be used on soft and swampy terrain where the standard excavator with standard shoe is not usable due to sinkage of the tracks. If such shoes are used in swampy fields with stones, stumps and roots, bending of the shoe plates, cracks in the links, breakage of pins, loosening of shoe bolts and other damage may result. Therefore, the job site must be studied carefully, to provide the customer with correct instructions and advice.

NOTE: The shoe for the long-track excavator (L and LC), wide shoe (excluding the narrowest shoe for a model) and swamp shoe are provided with low ground pressure. These shoes should be used on soft and swampy terrain where the standard excavator with standard shoe is not usable due to sinkage of the tracks. If such shoes are used in swampy fields with stones, stumps and roots, bending of the shoe plates, cracks in the links, breakage of pins, loosening of shoe bolts and other damage may result. Therefore, the job site must be studied carefully, to provide the customer with correct instructions and advice.

NOTE: The shoe for the long-track excavator (L and LC), wide shoe (excluding the narrowest shoe for a model) and swamp shoe are provided with low ground pressure. These shoes should be used on soft and swampy terrain where the standard excavator with standard shoe is not usable due to sinkage of the tracks. If such shoes are used in swampy fields with stones, stumps and roots, bending of the shoe plates, cracks in the links, breakage of pins, loosening of shoe bolts and other damage may result. Therefore, the job site must be studied carefully, to provide the customer with correct instructions and advice.

* Standard shoe

NOTE: The shoe for the long-track excavator (L and LC), wide shoe (excluding the narrow shoe for a model) and swamp shoe are provided with low ground pressure. These shoes should be used on soft and swampy terrain where the standard excavator with standard shoe is not usable due to sinkage of the tracks. If such shoes are used in swampy fields with stones, stumps and roots, bending of the shoe plates, cracks in the links, breakage of pins, loosening of shoe bolts and other damage may result. Therefore, the job site must be studied carefully, to provide the customer with correct instructions and advice.

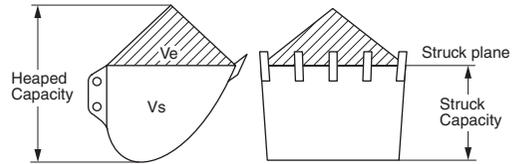

BUCKET CAPACITY RATING

Bucket capacity is measured in terms of either struck or heaped capacity. Generally, the heaped capacity description is more frequently used.

Komatsu Ltd. rates the excavator bucket capacity based on ISO and other standards such as JIS, PCSA and SAE (JIS and SAE are based on ISO.)

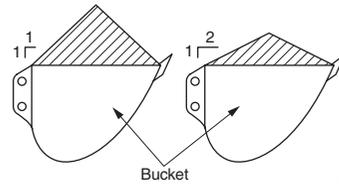

1) Struck Capacity

The struck capacity is the volume capacity of the bucket after it has been struck at the strike plane. The strike plane passes through the top back edge of the bucket and the cutting edge. (See top figure at right)

2) Heaped Capacity

The heaped capacity is the sum of the struck capacity plus the volume of material heaped on the bucket at a 1:2 angle of repose, as shown in the center figure at right. This in no way implies that the hoe must carry the bucket oriented in this attitude, or that all material will naturally have a 1:2 angle of repose.

FVBH0256

$V_h = V_s + V_e$ Where:

- Vs: struck capacity
- Vh: heaped capacity
- Ve: excess material heaped at 1:2 or 1:1 angle of repose

There are various standards for designating the heaped capacity of the bucket.

The principal difference among these definitions is the "angle of repose", as listed in the table below.

The angle of repose

Standard Bucket type	ISO	JIS	PCSA	SAE	CECE
Hoe bucket	1:1	1:1	1:1	1:1	1:2
Loading shovel	1:2	1:2	1:2	1:2	1:2

Notes:

- ISOInternational Organization of Standard - ISO 7451 and ISO 7546
- JISJapanese Industrial Standard - JIS A8401 - 1976
- PCSAPower Crane and Shovel Association (USA) - PCSA No.37-26
- SAESociety of Automotive Engineers (USA) - SAE J296/J742b

Bucket selection for excavator

Komatsu offers various kinds and sizes of buckets so that the users are able to select the optimum bucket for the type of soil and the work to be performed. This enables the work to be accomplished most efficiently. The following is a guide for selecting the optimum bucket.

1. Selection of type (shape)

Various types can be attached to excavators.

- General purpose bucket
- Light duty bucket
- Heavy duty bucket
- Narrow bucket (Ditch bucket)
- Rock bucket
- Ripper bucket
- Other special buckets

The appropriate type should be selected for each job application.

It is recommended to ask the Komatsu distributor about the availability of necessary buckets. When the necessary bucket is not currently available, the distributor can request Komatsu to develop it.

2. Selection of size

The following two points 1) and 2) should be considered altogether.

1) From the machine stability (For backhoe type)

If the bucket size (capacity) is too big, it will worsen the stability of the machine, resulting in danger of tipping over or rolling over.

The concept of the bucket selection from the point of machine stability is from the following.

Putting A as the maximum allowable load from over-side (sideways) machine stability and B as the bucket working load (bucket weight + carrying material weight), the size of the bucket should be selected so as to be;

$$B \leq A$$

From Figure 1,

$$A = W_1 + (L_0 / L) W_2 = W_1 + W_2 \text{ Approximately}$$

where, W_1 : The weight of the empty bucket shown in the table of Lift Capacity. The value of the weight is shown in the tables of "Bucket and Arm Combination".

W_2 : The smallest lift capacity in the table of Lift Capacity at respective boom length and arm length (The lift capacity differs by the arm vertical position)

From Figure 2,

$$B = W_3 + W_4$$

where, W_3 : The bucket weight used for the job

W_4 : The weight of carried material
(= rated bucket capacity \times specific gravity of carried material)

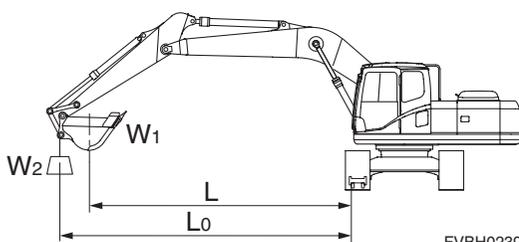

Figure 1

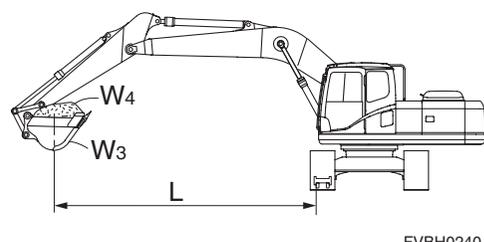

Figure 2

2) From the bucket penetration force

When selecting a bucket, check whether the penetration force of the bucket is sufficient for the soil at the job site. The bucket penetration force is the digging force per unit width of the bucket.

$$\text{Bucket penetration force} = \text{Digging force} / \text{Bucket width}$$

The larger the digging force per unit width of the bucket is, the larger the bucket penetration force (penetration performance) is.

The digging force is generated by the bucket hydraulic cylinder(s) and the boom hydraulic cylinder(s). In addition to the digging force, the width of the bucket and the tip radius (dimension from the bucket hinge center to the forefront of the bucket teeth) affects the bucket penetration force.

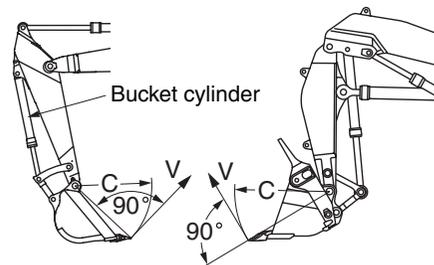

(1) Digging force

Rated digging force of the bucket is the force at the foremost digging point of the bucket. This digging force is generated by the bucket hydraulic cylinder and the arm hydraulic cylinder. The former is called the "Bucket digging force" and the latter is called the "Arm crowd force".

These digging forces are calculated by applying working relief hydraulic pressure to the cylinder(s). The weight of components and friction are to be excluded in the calculation. The definition of the digging forces are based on SAE J1179 and are as follows.

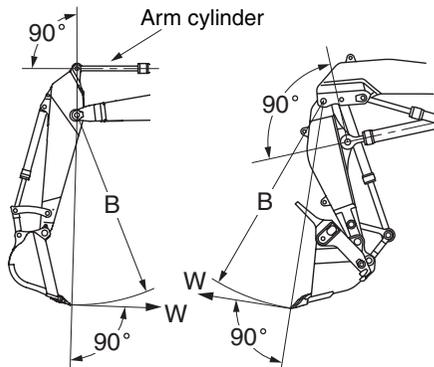

a. Bucket digging force

The rated bucket digging force (V, in the top figure) is the force generated by the bucket cylinder(s) and the tangent to the arc of radius C. The bucket should be positioned to obtain the maximum output moment from the bucket cylinder(s) and the connecting linkage.

b. Arm crowd force

The rated arm crowd force (W, in the bottom figure) is the force generated by the arm cylinder(s) and the tangent to the arc of the radius B. The arm should be positioned to obtain the maximum output moment from the arm cylinder(s) and the bucket, positioned as mentioned above.

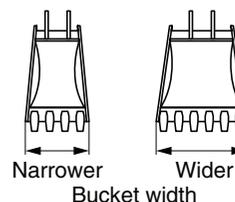

(2) Bucket width

The wider the bucket is, the worse the bucket penetration is. Generally speaking, a wide bucket is recommended for excavating soil that can be broken easily. A narrow bucket is better suited for work on hard soil.

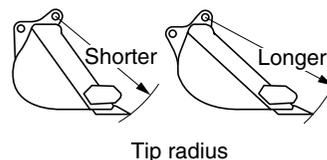

The width of the bucket must be limited also from the point of durability of the bucket, arm, boom and their hinge pins and bushings,. If the width is too great, it will cause excessive twist on the relevant parts, resulting in premature breakage or wear.

FVBH0018

(3) Tip radius

The tip radius also affects the digging force of the bucket. If the bucket cylinder is provided with the same pushing force, the bucket with the shorter tip radius is better able to dig hard soil than the bucket with the longer tip radius.

FVBH0045

The bucket width and the tip radius should be selected with the combination of the digging forces mentioned above in order to have appropriate bucket penetration.

When you need the values for allowable bucket width and bucket penetration force for each model, you can request and get the figures from Komatsu through your distributor.

Bucket and Arm Combinations

EXCAVATORS (BACKHOE)

This shows the bucket sizes currently available for respective models produced in various Komatsu plants, in relation with the arm length.

All allowable sizes from the concept of machine stability in "BUCKET SELECTION" are not shown, but it is possible for Komatsu plants to develop the various size buckets according to the theory of "BUCKET SELECTION", if it is requested through a distributor.

The theory of "BUCKET SELECTION" can be applied when a bucket is procured from a local attachment manufacturers. But the quality of the bucket from a local supplier can not be guaranteed by Komatsu.

These charts are based on over-side stability with fully loaded bucket at maximum reach.

* Wear-resistant bucket

** Wear package number

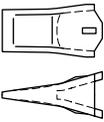

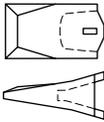

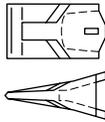

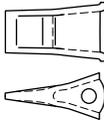

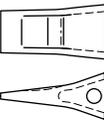

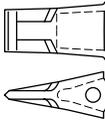

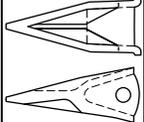

*** Side cutters, which increase the width of bucket, are not standard

Teeth Features

- 1) Long-life bucket tooth:
Fits the work site where wear resistance of the tooth is required because it must be used to collect sand and gravel.
- 2) Self-sharpened bucket tooth:
Fits the work site where penetration ease of the tooth is required because it must be used to dig rock and clay after blasting.
- 3) Super self-sharpened bucket tooth:
Fits the work site where penetration ease better than above is required because it must be used to dig rock after blasting.
- 4) Standard bucket tooth:
Fits other general work sites.

DEFINITIONS

Standard / Heavy Duty - The load on the machine ranges from very little to moderate with some limited, "high load" use. Materials range from light and loose, well-shot, fracturable, to some medium, even heavy shot materials that break up into manageable sizes when excavated. Large slabs of rock do not fit in this category.

Extreme Service ? The load on the machine is high, nearing the maximum capabilities of the machine. Materials are heavy un-shot rock or slabs that require the full force of the machine to break out.

3. KVX teeth

1) Features

- 1) Long service life of teeth
Free-turning teeth mean long-lasting resistance to wear (some specifications excluded).
- 2) Excellent wear resistance using Sagitta steel
Based on 130 years of experience in advanced heat-processing technology, teeth and lip plate (base edge) are afforded optimum wear resistance and hardness.
- 3) Tooth system without adapter
Teeth are affixed using secure bolts, meaning that no adapter is employed. Problems such as cracks do not occur. Since teeth are of a uniform thickness, excavation wear resistances do not change.
- 4) The same Sagitta steel is employed for the lip plate and teeth.
Special steel (Brinell hardness 520 Sagitta steel) is employed for the lip plate, rendering reinforcement of the rip plate unnecessary. This means a marked reduction in reinforcement costs is possible.

2) Teeth specification

1. Basic idea for excavator selection

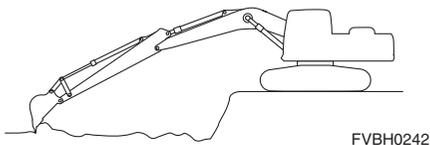

The concept of the combination of bucket size, arm length, and boom length for hydraulic excavators to match the nature of the operation is as follows.

Main-types of work

Combination

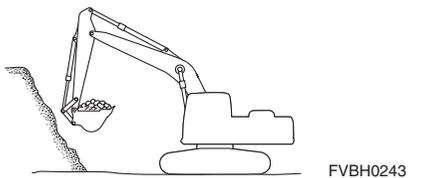

Boom/Arm + Bucket

1) Wider working range

Long boom
Long arm + Small capacity bucket

2) Larger production

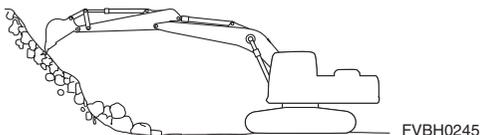

Short boom
Short arm + Large capacity bucket

3) Larger digging force, Larger lifting capacity

Short arm + Narrow bucket
+ Ripper bucket

4) Heavy-duty work

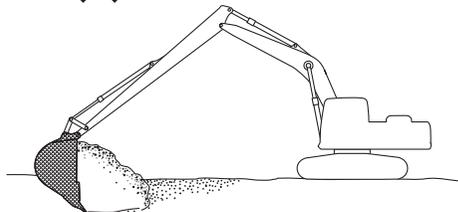

Strengthened boom
Strengthened arm + Heavy-duty bucket

2. Wrong combination

1) Long Arm with Large Capacity Bucket

If the machine is operated with a long arm and a large capacity bucket with a capacity larger than recommended, the machine will become unstable, and it will also lose digging power, so the operating efficiency will drop. In particular, if a strong shock load is applied to the bucket, there is danger that the arm may break.

✗ Wrong

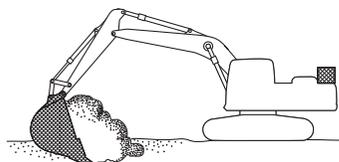

FVBH0246

2) Additional Counterweight

If an excessive capacity bucket or heavy attachment is installed, the machine will become unstable, so it is common to see additional counterweights used. However, this means that an excessive load is applied not only to the work equipment and undercarriage, but also to the whole machine, so this will lead to a reduction in the service life of the machine.

✗ Wrong

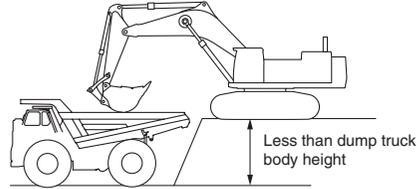

FVBH0247

3. Concepts for selection of backhoe type and loading shovel for large hydraulic excavators

1) Bench height (ease of loading)

From the point of view of the ease of loading a dump truck, a guideline is to select a loading shovel if the height of the bench is more than 5 m (16'5"), and a backhoe type if the height of the bench is less than 5 m (16'5").

For the backhoe type to load a dump truck efficiently, the bench height should be less than the dump truck body height.

FVBH0248

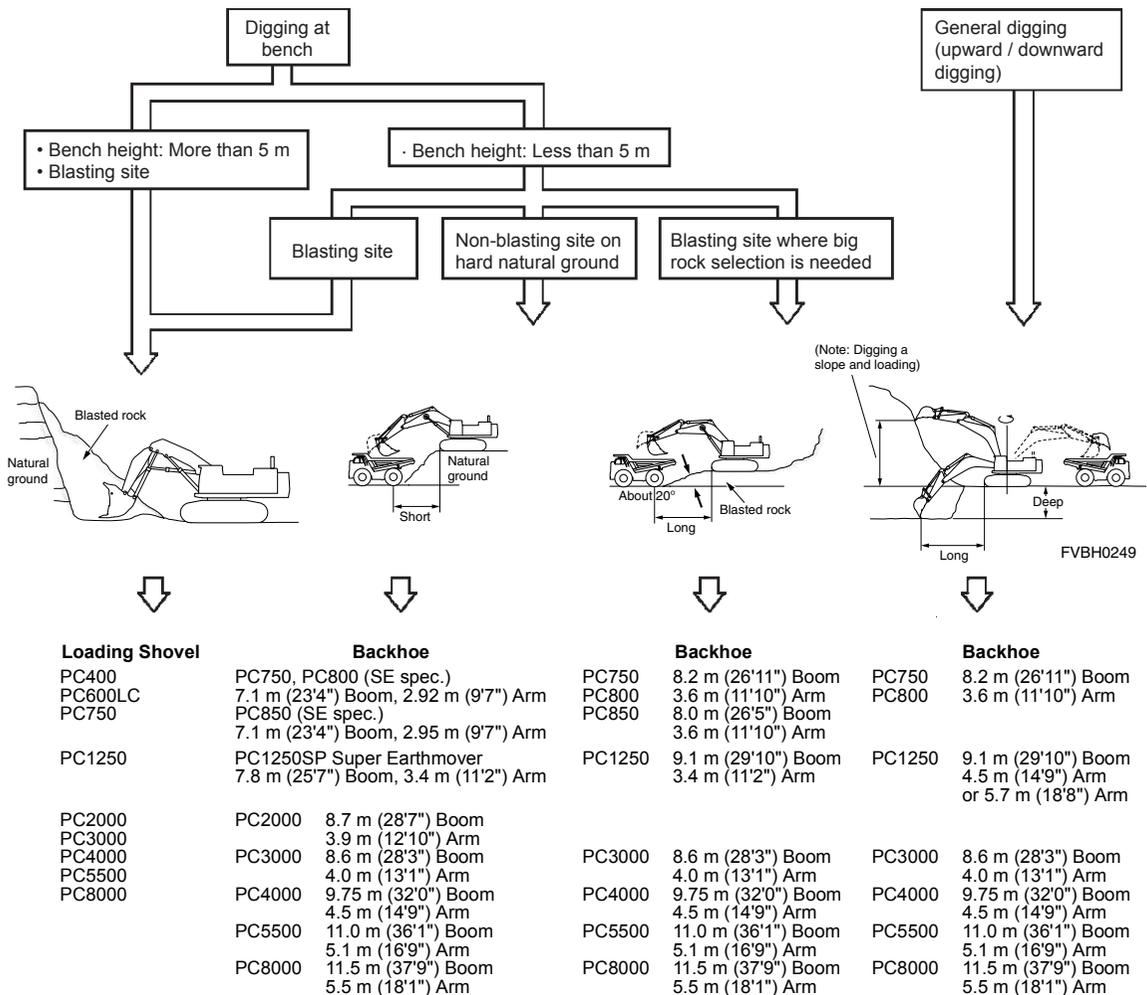

2) Digging function

Loading shovel : This is better for loading blasted rocks where there are many large lumps and digging force is required. When digging flat surfaces, its horizontal pushing force is strong and it can show its power, but it is difficult for it to use its pushing force when digging above ground level.

Backhoe : This is an all-round attachment for digging and loading. When increasing the bucket size to ensure production volume, make the work equipment (arm, boom) shorter.

Large Size Hydraulic Excavator Work Equipment Selection Guide

Select the work equipment for large hydraulic excavators as follows.

NOTE: The bucket size depends on the specific gravity (loose) of the material loaded. For details, see Bucket and Arm Combination.

Note: B/H: BACKHOE

Number of loads: 4 ~ 8 Suitable, (3)(9) ~ (11) Possible

Above combination is determined by following method;

(1) Suitable loading times (n):

$$n = \frac{\text{Max. payload of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor} \times \text{Specific weight}} \text{ or } n = \frac{\text{Heaped capacity of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor}}$$

Number of loading times is calculated based on following condition.

1. Calculate number of loading times from maximum payload of dump truck.

Please see formula 1.

2. Calculate number of loading times from body capacity of dump truck.

Please see formula 2.

3. Adopt lower number between formula 1 and formula 2.

Formula 1

Number of loading = Payload of truck (metric tonnes) / (Bucket capacity of loader (m³) × loose density × bucket factor)

Formula 2

Number of loading = Body capacity (cubic meter) / (Bucket capacity of loader (m³) × bucket factor)

We adopt following condition.

Density = 1.8 metric tonnes per cubic meter

Bucket factor = 1.0

Calculated number of loading times are rounded off to the first decimal place.

SECTION **2B**

MINIMAL SWING RADIUS EXCAVATORS (UU)

UU stands for “Ultra Urban” machine.

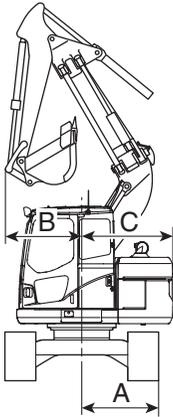

CONTENTS

Features 2B-3
Specifications 2B-4
Dimensions 2B-5
Working Ranges and Digging Forces 2B-6
Lifting Capacity 2B-7

MINIMAL SWING RADIUS EXCAVATORS (UU)

Minimal Swing Radius Excavator means the excavator having an upper structure with its equipment and attachments swinging within 120% of the width of the undercarriage. (Defined by ISO 6165)

UU stands for "Ultra Urban" machine named by Komatsu and equivalent to Minimal Swing Radius Excavator.

$$B < A$$
$$C \leq 1.2A$$

Wide working ranges and small swing radius

- The small swing radius of the work equipment facilitates operations even in confined spaces
- Easy side ditching with large offset width
- The largest working range in this class
- Largest digging force in its class

Low-noise machine, optimum for work in urban areas**Safe and comfortable operations**

- Smooth swing control
- Three-pump hydraulic with independent swing control facilitates simultaneous operation
- Superior fine control performance
- Cushion cylinders reduce shock
- Light control effort for levers and pedals
- Simple boom offset operation
- One-touch lock for all work equipment levers.

Excellent durability and easy maintenance

- Highly evaluated welded assembly type shoes
- Automatic air bleeding for fuel system
- Dust seals fitted around work equipment pins
- In-shoe motor gives neat undercarriage
- Full-open hood facilitates inspection and maintenance

* Load is limited by hydraulic capacity rather than tipping.
 Ratings are based on SAE Standard NO. J1097. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

* Load is limited by hydraulic capacity rather than tipping.
 Ratings are based on SAE Standard NO. J1097. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

* Load is limited by hydraulic capacity rather than tipping.

Ratings are based on SAE Standard NO. J/ISO10567. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping loa

SECTION **2D**

ATTACHMENTS

CONTENTS

Buckets & Rippers for Backhoe:

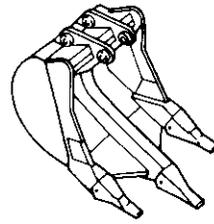

- Ripper Bucket 2D-2
- Trapezoidal Bucket 2D-2
- Slope Finishing Bucket 2D-2
- Ditch Cleaning Bucket 2D-2
- Single-shank Ripper 2D-2
- Clamshell Bucket 2D-2
- Coal Bucket and Chip Bucket 2D-3
- Chip Yard Bucket 2D-3

Attachments for General Construction:

- Telescopic Arm (Box Slide Type) 2D-4
- Telescopic Arm (Upper Arm Sliding Type) 2D-4
- Super Long Front 2D-5

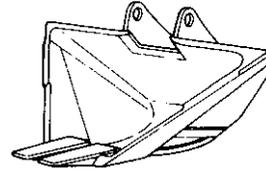

Ripper Bucket

Suitable for digging rock bed or hard clayey soil when normal buckets cannot penetrate deep enough. Loading is also possible.

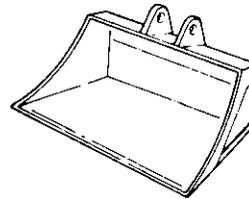

Trapezoidal Bucket

Performs digging and sloping simultaneously on a drainage or irrigation canal. Using this bucket will leave the digging profile shaped as a cross-section.

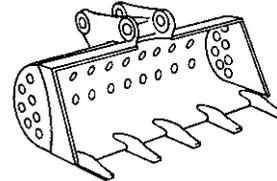

Slope Finishing Bucket

The wide bucket width and flat bottom make this bucket suitable for smoothing the slopes of irrigation canals, roads or river banks.

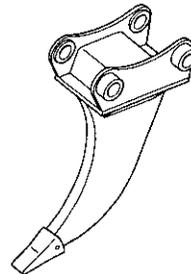

Ditch Cleaning Bucket

Most suitable for cleaning a river or dredging soft soil from the river bed. The bucket has small holes which allow the water to drain, retaining only solid objects of the ditch.

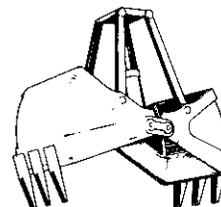

Single-shank Ripper

This ripper is used for site preparation prior to digging work, when it becomes necessary to remove rocks, pavement for other obstacles. Also effective for pulling out tree stumps.

Clamshell Bucket

- Improved work efficiency with the clamshell bucket pushing method.
- Handy 360-degree manual rotation
- Superb earth digging and discharge performance

Coal Bucket and Chip Bucket

An excavator with INBOARD MATERIAL HANDLING SPECS greatly improves the working efficiency, safety and working environment when handling inboard materials like coal or chip and, in addition, its introduction leads to labor-savings.

Coal bucket

Bucket capacity : 1.3m³ (PC130, PC138US)

Chip bucket

Bucket capacity : 1.9m³ (PC130, PC138US)

PC130 (FOR COAL HANDLING SPECS)

FOR CHIP HANDLING SPECS

Chip Yard Bucket

An excavator with CHIP YARD SPECS provides a large capacity bucket which increases its loading efficiency higher and chip-proof structure to protect chip intrusion from the hood and exterior covers around the engine.

Bucket capacity

PC350LC 6.0m³

PC400 7.0m³ (Loader shovel)

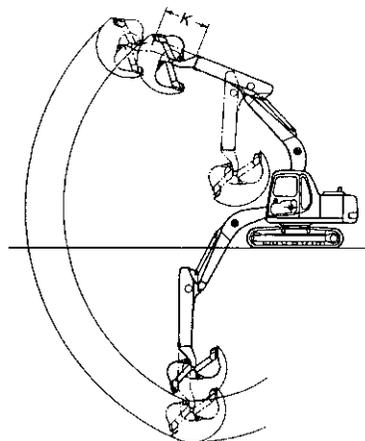

PC400

Telescopic Arm (Box Slide Type)

- Most suited to deep excavation in a closely built-up area or in a site near overhead obstacles such as power cables which limits the size of machine that can be used.
- Greatly increases working range, being capable of the same as machines two classes higher.
- Light but highly rigid box type arm.

Unit : mm (ft in)	
	Sliding amount (K)
PC78US	1100 (3'7")

Telescopic Arm (Upper Arm Sliding Type)

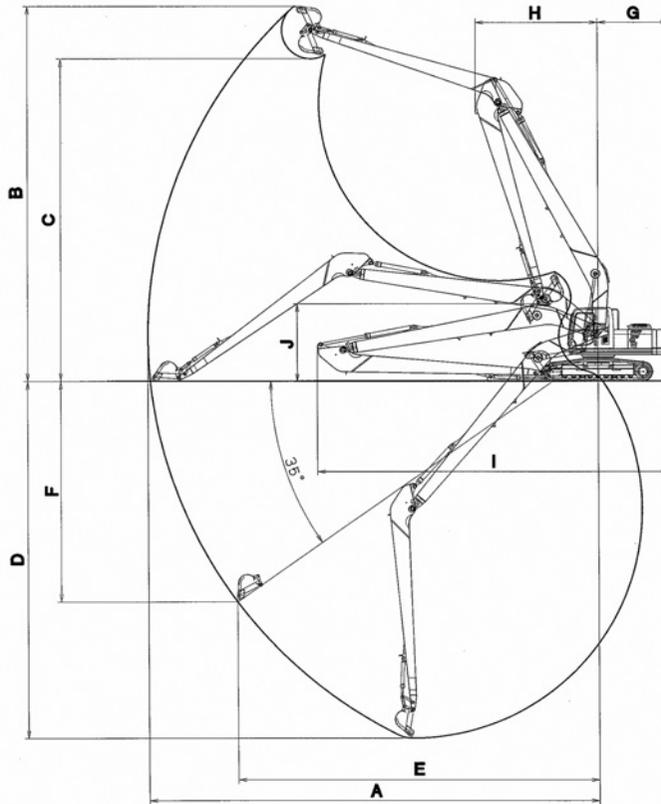

- With the arm elongated, the machine can dig to the same depth as machines three classes higher. Useful attachment for restricted job sites where a wide working range is needed. Also slope-finishing work can be done with ease.
- Sliding mechanism using rollers on the slide surfaces makes adjustment easy and prevents vertical and horizontal vibrations of the arm, minimizing the wear which shortens arm life.
- Thanks to the hydraulic sliding system, the arm telescopes speedily, providing high working efficiency.

Unit : mm (ft in)	
	Sliding amount (K)
PC130	2100 (6'11")
PC200LC	2430 (8'0")
PC78US	1800 (5'11")
PC138US	2100 (6'11")
PC228USLC	2430 (8'0")

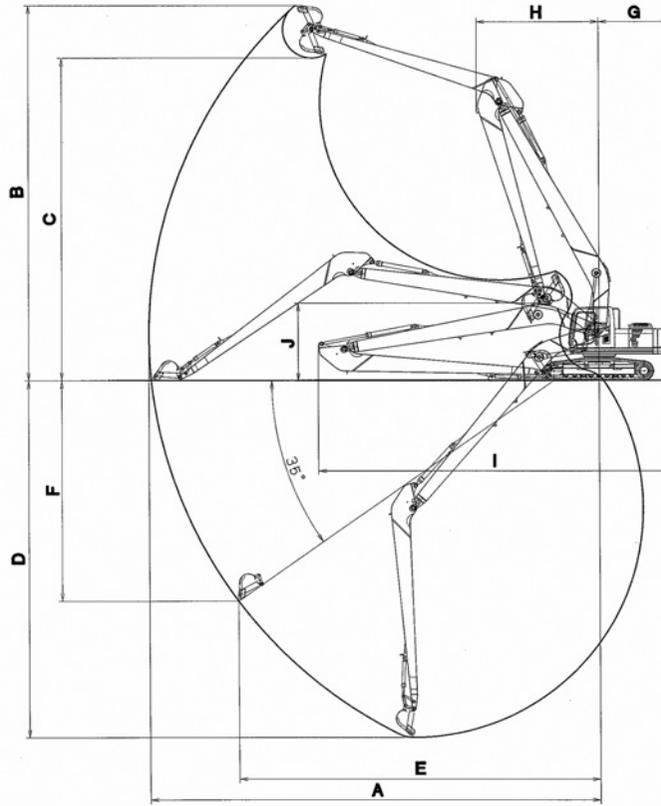

Super Long Front

SUPER LONG FRONT attachment boasts a huge digging reach. An excavator with this attachment highly improves working efficiency in various works such as river conservation, lake dredging, slope-finishing and materials carrying where an extensively long reach is required.

Komatsu Mining Shovel Front Shovel Features

High production with low running costs

High digging forces provide fast cycle times and low cost per tonnage

Environmental harmony

- Komatsu engines which meet EPA, EU and Japan emission regulations
- Extended oil change intervals and filter replacement intervals to reduce environmental impacts
- Long term experience in use of biological hydraulic oils and lubricants, as an option available

Large, comfortable and safe mining operator's cab

- Integrated FOPS structure according to ISO 3449
- Internal floor area about 4.2 m²
- Large windows for good all around visibility
- Side sliding windows
- Pressurised to keep dust out
- Noise level in cab approx. 76 dB(A) according ISO 63096
- High intensive XENON working lights.
- Cab heating and air conditioner of 10 kW
- Comfortable multi-functional operator seat with internal heating
- Second swing out fold away seat for trainer
- Wash-hand basin
- Refrigerator

ECS or VHMS monitoring system for greater machine efficiency and low maintenance time

- Comprehensive overview of shovel functions with operator friendly display
- Optional data transfer possibility via Modular Mining System controller
- All important machine running data are monitored and electronically stored, with down load facility
- Acoustic and visually alarms warn of machine malfunctions

Komatsu Engine

- Latest engine technology compliant with emission regulations
- Engine life time self cleaning stainless steel engine oil filter (ELIMINATOR) to avoid filter change; only filter cleaning at every 1000 hours is required
- Engine oil management system (Reserve and Centinel system) to extend oil change intervals up to 4000 hours
- Fuel tank capacity for continuous work up to 24 hours

Electric drive as option

- Electric motor 6600/7200 V and 50 or 60 Hz available
- Squirrel cage motor with soft start
- Optimized electrical design for all international standards
- Compact design with low vibration and noise
- Cable drum with automatic tensioning, as option

Komatsu hydraulic system HYDRO-PILOT

- Multi-circuit hydraulic system with electronic load governor, pump flow summation capability, and oil flow priority based on demand, for fast working cycles and high productivity
- All main hydraulic circuits are run at one pressure level only, simplifying pressure adjustment and service
- Each circuit with connection facility for pressure check gauges
- Changing from front shovel to backhoe is simple
- Un-pressurised hydraulic tank with large pump suction lines and low pump speed prevents risk of cavitation
- Each hydraulic circuit protected with high pressure filters
- Full flow 10 µm return line filters for system safety and for supplementary circuits 3 µm by-pass filter to improve oil quality for long component lifetime
- Swing out hydraulic cooler for simple cleaning to keep the cooling efficiency
- Float valves for improved hydraulic system

Heavy-duty shovel undercarriage design

- Komatsu Mining track system with oscillating shoes for optimum response to rugged mining ground conditions
- Lifetime lubricated rollers
- Automatic track tensioning system
- Track shoes in high quality casting steel and engineered by finite element method
- Precision hard facing of contact surfaces for long term performance
- Different width of shoes available for best performance in softer mining ground conditions

Attachments

- Front shovel attachment available for all mining applications
- Closed box design combining steel plates and castings, engineered by finite element method for full lifetime
- Wide selection of buckets and customised options
- Bucket wear package ranges to meet all mining conditions
- Attachment pin sealing arrangement for reduced bearing wear-parts costs

Service

- Hydraulically assisted ladder for ease and convenience access
- Upper structure walkway allows safe access to all service points
- Walk in machinery house provides all weather protection for service attention
- Automatic central lubrication system for attachment and main swing bearing
- Swing down service arm for fast, ground level refilling and evacuation and the minimizing of leakages during service
- Complete machine delivered in pre-tested modules for fast erection on job site

* Standard shoe

NOTE: The shoe for the long-track excavator (L and LC), wide shoe (excluding the narrowest shoe for a model) and swamp shoe are provided with low ground pressure. These shoes should be used on soft and swampy terrain where the standard excavator with standard shoe is not usable due to sinking of the tracks. If such shoes are used in swampy fields with stones, stumps and roots, bending of the shoe plates, cracks in the links, breakage of pins, loosening of shoe bolts and other damage may result. Therefore, the job site must be studied carefully, to provide the customer with correct instructions and advice.

Loading Shovel Buckets

HYDRAULIC LOADING SHOVELS

The bucket weight is heavier than the tilt-dump bucket. However, its characteristics of vertical dumping provide the following features

- Accurate loading is possible, because it is easy to position the bucket on the dumping point.
- Load spillage is less.
- Larger dumping clearance permits easier loading on the hauler.
- As it is possible to more closely position the bucket over the hauler's body, loading shock to the hauler can be minimized, extending the service life of the hauler.
- As a result of the above advantages, the cycle time is shortened.

Number of loads: 3–7 Suitable

Note: L/S: LOADING SHOVEL

Above combination is determined by following method;
(1) Suitable loading times (n): 4–6 times

$$n = \frac{\text{Max. payload of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor} \times \text{Specific weight}} \text{ or } n = \frac{\text{Heaped capacity of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor}}$$

Number of loading times is calculated based on following condition.

1. Calculate number of loading times from maximum payload of dump truck.
Please see formula 1.
2. Calculate number of loading times from body capacity of dump truck.
Please see formula 2.
3. Adopt lower number between formula 1 and formula 2.

Formula 1

Number of loading = Payload of truck (metric tonnes) / (Bucket capacity of loader (m³) x loose density x bucket factor)

Formula 2

Number of loading = Body capacity (cubic meter) / (Bucket capacity of loader (m³) x bucket factor)

We adopt following condition.

Density = 1.8 metric tonnes per cubic meter

Bucket factor = 1.0

Calculated number of loading times are rounded off to the first decimal place.

SECTION **2F**

WHEEL-TYPE EXCAVATORS

CONTENTS

Features	2F-2
Specifications	2F-3
Dimensions	2F-6
Working Ranges, Digging Force	2F-8
Bucket and Arm Combinations	2F-10
Lifting Capacity	2F-12

High mobility

- A high-power KOMATSU engine gives it a higher travel speed for quick relocation.
- Four-wheel drive and double tires both front and rear make it easy to travel over rough or soft terrain.

High working performance

- Large working range and strong digging force.
- The PC system makes full use of engine power.
- A two-pump merge system increases work equipment speed and reduces cycle time.
- Smooth, responsive swing starts and stops.
- High lifting capacity and good stability.

High operating versatility

- Extra-small swing radius boosts operating versatility.
- Excellent stability due to oscillation lock cylinders and double tires.

Enhanced operator comfort

- Hydrostatic drive system assures smooth, easy travel speed changes.
- Newly designed cab offers greater comfort.

Excellent safety and easy maintenance

- Four wheel disc brake with positive braking
- One of the features now on the new wheeled excavator is a walkway across the excavator superstructure, giving easy access to the engine compartment.
(PW180-7, PW200-7, PW220-7)

In harmony with the environment

- Low emission engine
The powerful turbocharged and air-to-air aftercooled Komatsu SAA4D107E and SAA6D107E engine meets Tier 3 and Stage 3A emissions standards with increased power and machine productivity.
- Economy mode reduces fuel consumption
- Low operating noise
- Designed for easy end of life recycling
(PW140 and over)

Undercarriage

- Designed for high ground clearance
- High oscillation angle
- Virtually zero axle rocking with outboard wet disc system
- Powerful drawbar pull
- Automatic 3-speed travel
- Class leading 35 km/h maximum travel speed
(PW140-7 and over)

SpaceCab™

The new PW140/160/180/200/220-7's cab space have been increased by 14%, offering an exceptionally-roomy operating environment.

- High-pressurised cabin with optional air conditioner
- Low-noise design
- Low-vibration design with cabin damper mounting
- Cab moved forward for better visibility
- Ergonomic control levers
- Seat specially designed for wheeled machines, with exceptional extra comfort.
(PW140-7 and over)

* Load is limited by hydraulic capacity rather than tipping.
Ratings are based on SAE Standard No.J1097.
Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

Machine and Attachments

Machine Selection (Guide Line) 2G-2

Specifications:

Demolition Specification 2G-3

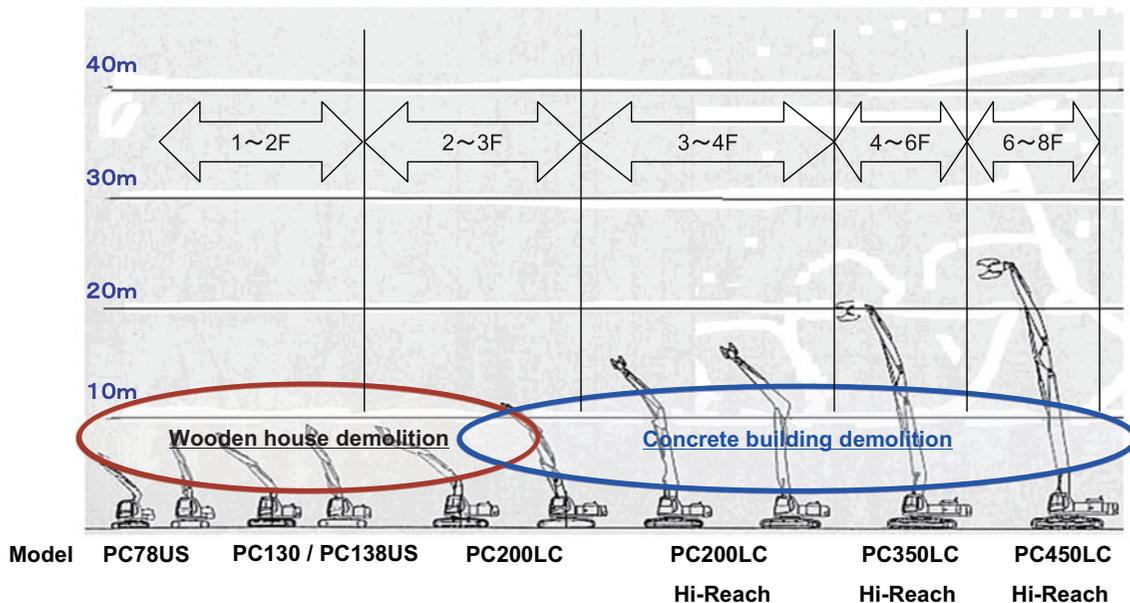

Demolition High Reach 2G-4

Demolition Two Piece Boom 2G-10

Underground Demolition Specifications 2G-11

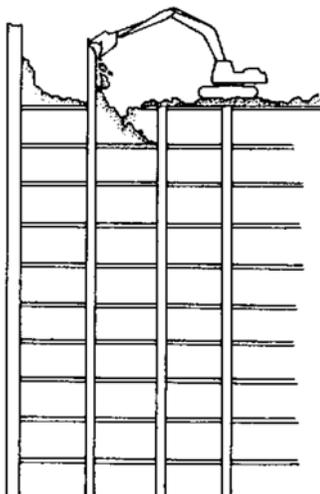

1. When carrying out demolition of concrete building from the ground

- 1) For demolition of 4~10 storied buildings use a hydraulic excavator with a super long boom and arm as base machine.
- 2) For demolition of 2~4 storied buildings use a hydraulic excavator with a normal boom and arm as the base machine.
- 3) For demolition of the foundations or areas below ground level, use a hydraulic excavator with the normal boom and arm as the base machine and operate from the ground level. If necessary, lower the machine below the ground to carry out the work.

2. When carrying out demolition from inside the building being demolished

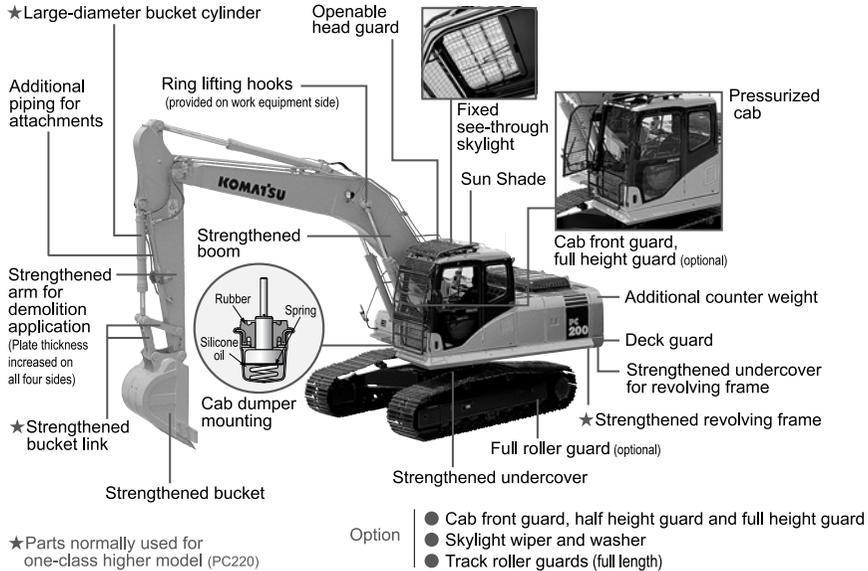

There is no space to carry out demolition work with machine from the ground level, or the building is too high (higher than 6 stories) to demolished, and the demolition attachment does not reach, place the demolition machine on the top floor of the building to be demolished. Start the demolition operation from the top, and work down.

Specifications Demolition Specification

DEMOLITION

- Demolition work means hard work for hydraulic excavators. Operator safety, machine flexibility, reliability and performance are essential for this application.
- Demolition specification features additional machine guarding, reinforced structure and better visibility that enables safer and more efficient operation.

Specifications Demolition High Reach

DEMOLITION

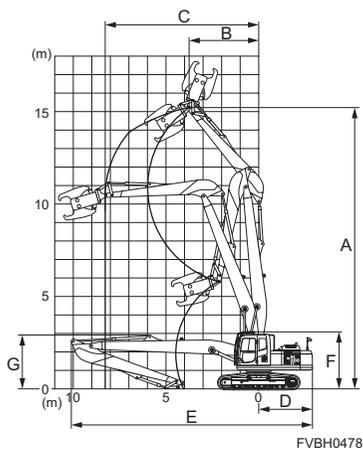

- Demolition high reach enables high efficient operation and safety for 3-4 stories building demolition.
- Two-stage front type provides easy demolition operation thanks to the same lever motion as standard machine.

Working Range

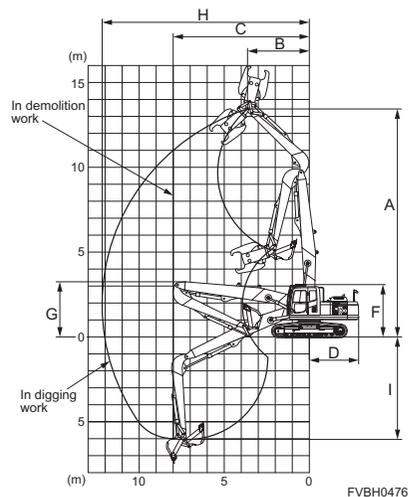

PC200LC

(2-stage type for demolition work only)

PC200LC

(2-stage type for demolition and digging work)

Specifications

Model		PC200LC	
Structure	High reach type	2-stage

Max. Allowable Working Radius	C mm(ft.in)	8,300(27'3")	8,000(26'3")
Tail Swing Radius	D mm(ft.in)	2,940(9'8")	2,940(9'8")
Overall Length *3	E mm(ft.in)	13,260(43'6")	11,090(36'5")
Overall Height *3	F mm(ft.in)	3,160(10'4")	3,160(10'4")
Height of Folded Work Equipment	G mm(ft.in)	2,850(9'4")	3,000(9'10")
Arm Top Pin at Max. Working Radius	H mm(ft.in)	—	12,210(40'1")
Arm Top Pin at Max. Working Depth	I mm(ft.in)	—	6,165(20'3")

* The photos may slightly differ from the standard specifications of demolition high reach.

* For precautions when operating the machine, refer to the operation and maintenance manual.

*1 Excluding allowable crusher weight

*2 Arm top pin

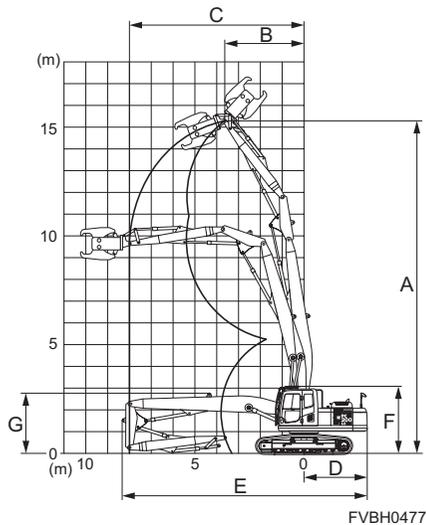

*3 When work equipment is folded and lowered to the ground

- Demolition high reach enables high efficient operation and safety for 3-4 stories building demolition.
- Three-stage front type suits for delicate demolition work thanks to the intermediate arm that ensures the wider working range than 2-stage type.

Working Range

Specifications Demolition High Reach

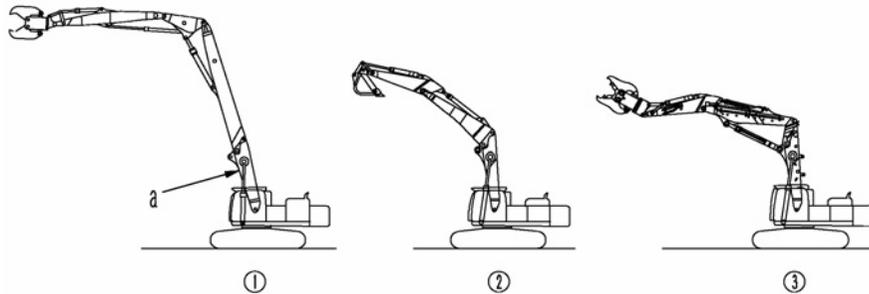

DEMOLITION

- There are several stages at the demolition works such as demolishing structures, taking out debris, leveling ground etc. which are required several machines at each process.
- The exchangeable fronts system can reduce the cost and time for demolition works. Three types of equipments are available by exchanging front equipment at one machine.
- Safety devices are equipped such as working range monitor, wide view front glass etc.

Demolition spec. outline

There are three kind of work equipment configuration.

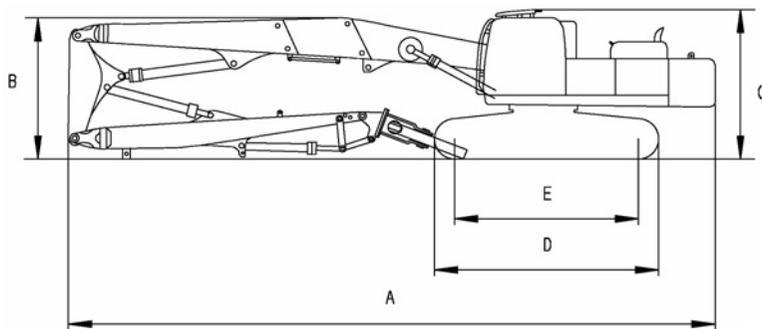

- (1) Hi-reach demolition spec.
- (2) Demolition excavation boom spec.
- (3) Demolition two-piece long front spec.

(a)'s first boom is a common for the above three configuration spec.

- The demolition two piece boom now realizes a higher, wider and longer working range.
- It has also made possible demolition work comparable to a one-class larger machine in a tight quarter.
- It demonstrates power when demolishing low-rise to mid-rise building now that it can access closer to a building to be demolished.
- The base machine is designed for demolition work. Various critical parts and work equipment have been strengthened to ensure higher durability. Thus it demonstrates excellent performance in the hard working conditions.

The two piece boom enables an operator to reach a higher work point.

DEMOLITION

- A breaker and crusher for a one-class larger machine (PC200 class) can be installed.
- A regenerative circuit assures a hydraulic oil amount equal to that for one-class larger machine (PC200 class) in the crushing work.
- A two piece boom is adopted.
- A low height cab is installed, allowing the machine to pass under 2,530 m (8'4") high beam.
- Ring hooks for lifting the machine are installed as a standard equipment.

Scrap Handling Machine

Long Boom and Gooseneck Arm

- Mounted on the machine body these give you increased working height-and safe, easy loading and unloading at those heights. The extended working range pays off in greater scrap-handling efficiency.

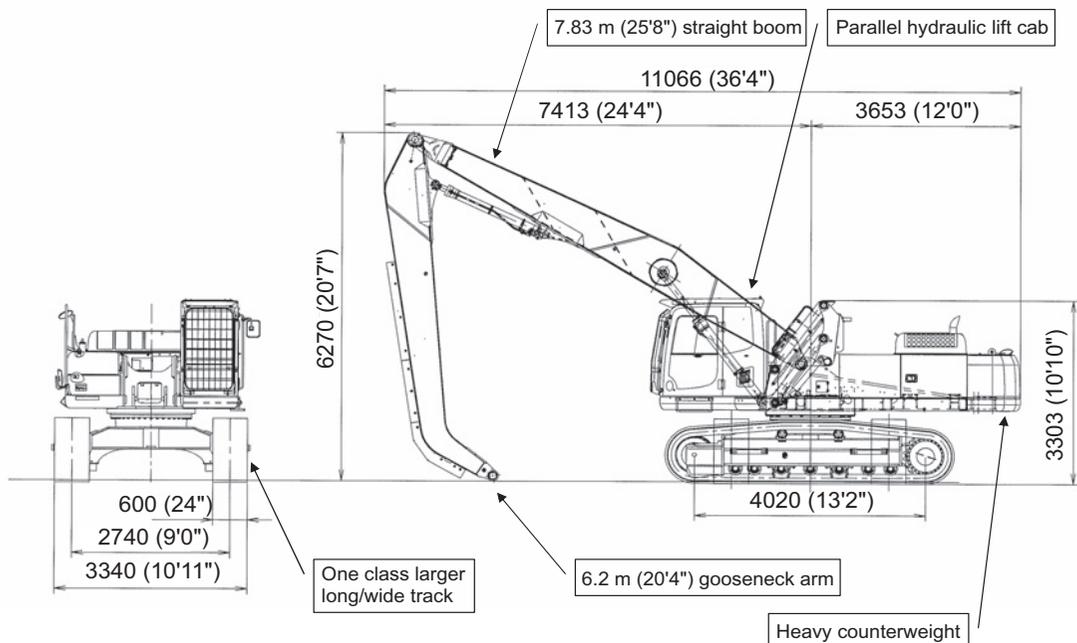

The Komatsu Scrap Handling Machine consists of:

- Basic Machine (See catalog for standard machines.)
- Scrap-handling long boom and gooseneck arm
- Grapple hydraulics
- Boom cylinder hydraulic line and drift-prevention valve
- Bolt-on additional counterweight
- Optional high-mount cabs (fixed, with ladder, or hydraulic elevator)
- Optional widened track gauge: For enhanced lateral stability, we can customize the basic machine's track gauge.

Dimensions & Working range

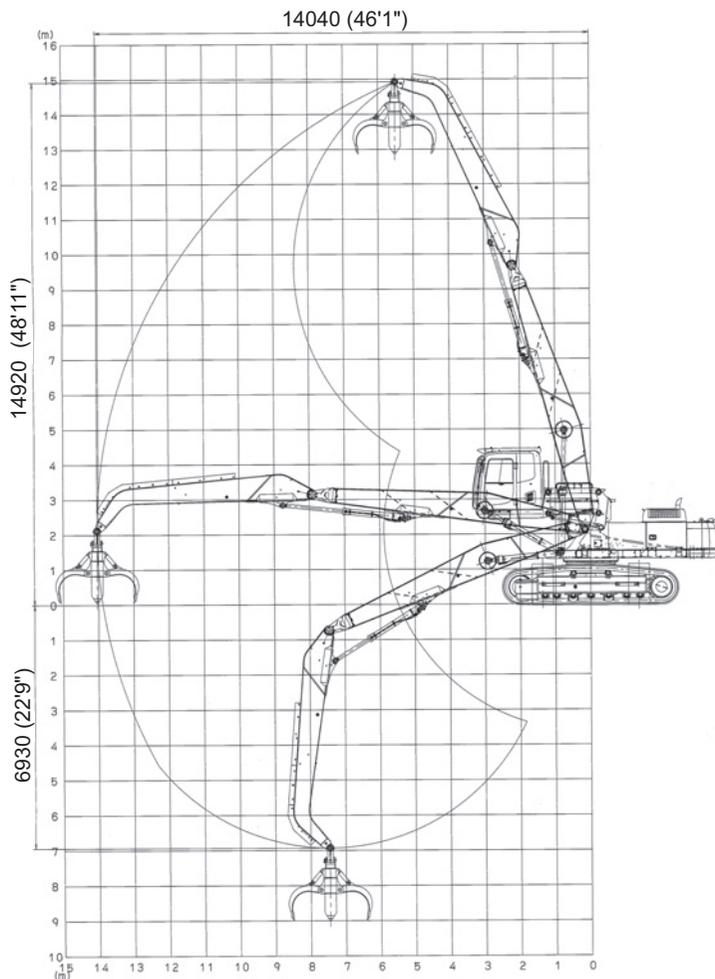

PC300 14 m (46') reach with hydraulic lift cab

Scrap Handling Machine

PC300 14m (46') reach spec with hydraulic lift cab

Working range

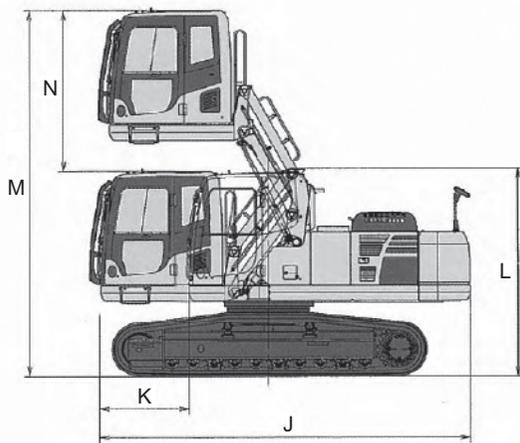

Model		PC300
Boom length	m (ft.in)	7.83 (25'8")
Arm length	m (ft.in)	6.2 (20'8")
Max. reach, at arm end pin	m (ft.in)	14.04 (46'1")
Max. height, at arm end pin	m (ft.in)	14.92 (48'11")
Max. digging depth, at arm end pin	m (ft.in)	6.93 (22'9")

High-mount Cab

A high-mount cab provides the operator with wider and clearer field view, thus facilitating loading or unloading of scrap on or off a truck and charging or discharging into or out of scrap processing machines. The hydraulic elevating cab lowered ensures better transportability.

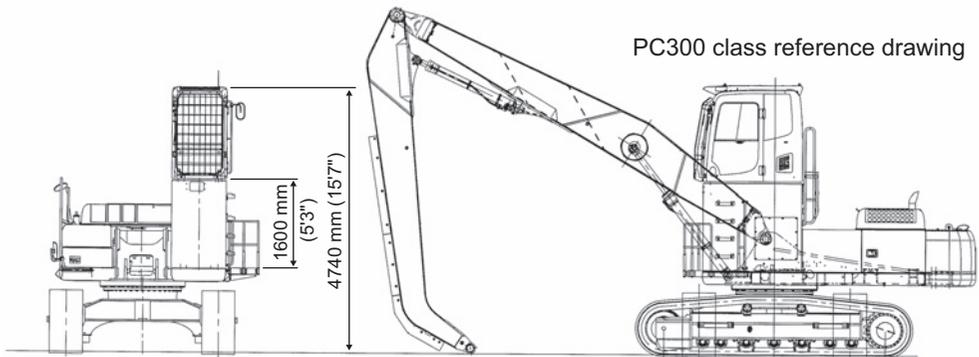

Parallel link cab

Dimension

	Model	PC200	PC220	PC300	
J	Overall length	mm (ft.in)	5,485 (18'0")	5,485 (18'0")	6,310 (20'8")
K	Cab protruding amount [compared with std cab]	mm (ft.in)	1,310 (4'4")	1,310 (4'4")	1,310 (4'4")
L	Height at cab lowest position	mm (ft.in)	3,075 (10'1")	3,085 (10'1")	3,195 (10'6")
M	Height at cab fully raised	mm (ft.in)	5,430 (17'10")	5,440 (17'10")	5,540 (18'2")
N	Lift height	mm (ft.in)	2,400 (7'10")	2,400 (7'10")	2,400 (7'10")

Fixed hi-cab (1.6 m (5'3") height)

Lifting Magnet

- Lifting magnet with strong attraction force by over-excitation and swift release by reverse excitation.
- Engine-driven brushless alternator, realizing a maintenance free operation.

PC200LC
Wide shoe: option

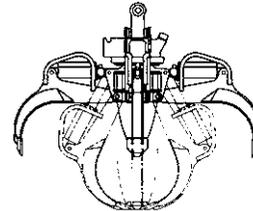

Car Scrap Handler

- With one car scrap handler, preparation, dismantling, and sorting work can be carried out speedily!
The combination play between a state-of-the-art machine and a clamp arm makes delicate removal operations possible!
- Powerful clamp arm! The clamp arm installed to the track frame can hold the scrapped car securely, so picking-up work can be carried out efficiently and smoothly.

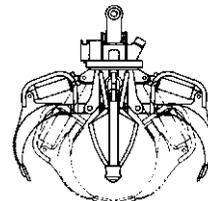

Scrap Grapple

To assure safe handling of massive or irregularly shaped scrap, each of the 4 claws opens and closes by independent hydraulic cylinders. The grapple rotates freely to make grappling readjustments safe and easy.

Orange Grapple

The claws are 4 vane-shaped blades operated independently by hydraulic cylinders. The freely turn-able grapple surrounds the scrap material; grasps accurately, and keeps small-item spillage to a minimum.

Magnet Fork

An excavator-based machine with a lifting magnet and fork device exhibits the best operating performance in scrap handlings by itself through the combination of both the MAGNET absorbing and FORK grapple forces, thus enabling great improvement of working efficiency, because materials to be handled can be freely selected.

Inboard Work Specifications

PC138US Inboard work spec.

- (1) Wide working range can speedy inboard work at vessel corner and high position work.
- (2) Short tail swing type can meet with tight working conditions.

20% large fuel tank capacity for long refill interval

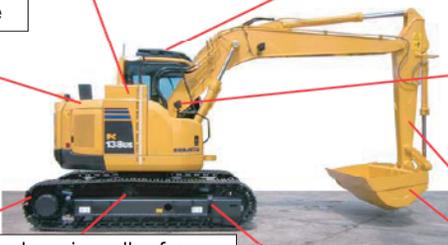

Head guard

Engine room cover for preventive chip and dust intake

Four additional working light

Holed shoe for preventive chip stack

Spiked carrier roller for chip removal from track link

Hook for machine lifting

Strengthened arm and link

Large capacity chip bucket

Sling hook

Photo shown PC138US-2 former model

Backhoe Dredger

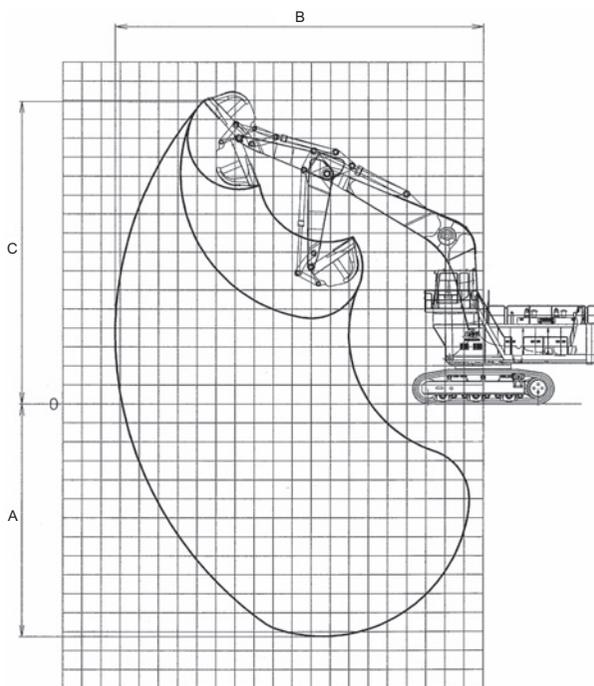

An excavator based machine with BACK-HOE TYPE SPECS mounted on a vessel exhibits its best operating performance in large-scaled ocean works such as filling-up reclamation to build a land, adjustment or enlargement of harbors and demolition or rehabilitation of breakwaters. As for mounting method, besides an excavator type with undercarriages, two methods (gantry- and fixed-type) are provided.

The work in a salty environment is necessary to prevent corrosion of parts.

Antit-corrosion arrangement is also available.

* : Material weight up to 1.8t/m³ (3,000 lb/cu.yd)

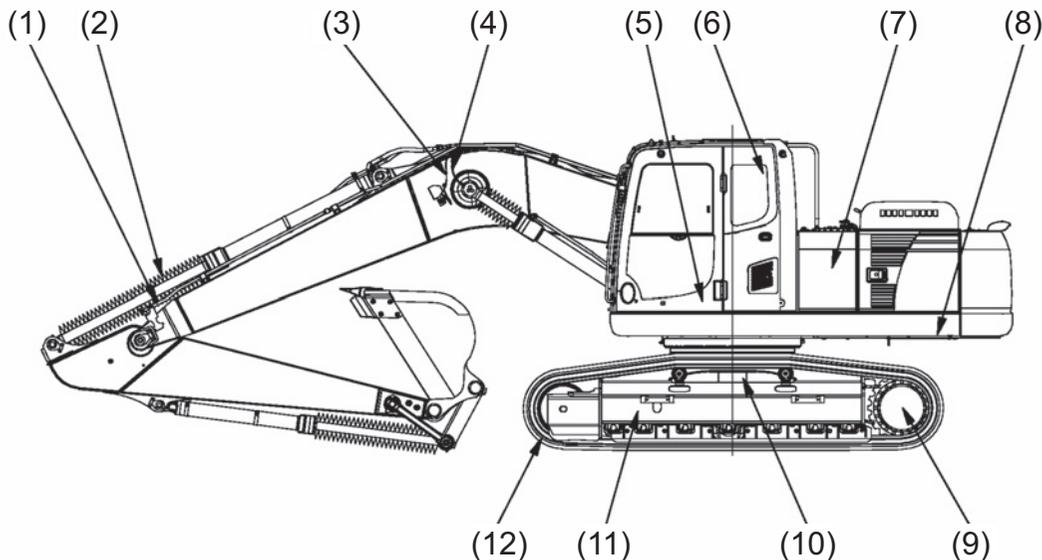

Sand & Gravel bucket and Soft clay bucket etc. is fitted depend on job conditions.

Heat Resistance Specifications

The works at a steel mill in a high temperature work place, typically a slag yard, is always fraught with various problems and danger like early deterioration and corrosion of parts and ignition

Heat resistance specification are developed to protect machine from those tough working condisions.

PC350 / PC450 Heat resistance specification

(1) Heat resistance type hydraulic hoses	(7) Heat resistance type fuel hoses
(2) Hydraulic cylinder rod protective cover (boom, arm and bucket)	(8) Revolving frame under guard
(3) Work lamp wiring harness protect by cover wound	(9) Travel motor hydraulic hoses (Heat resistance type)
(4) Heat resistance type greasing hose	(10) Track frame under guard
(5) Heat resistance hoses between boom and machine	(11) Heat resistance type roller's seal (idler, carrier, track rollers and final drive)
(6) Fire extinguisher (equipped inside and outside cab)	(12) Metal type shoe link seal

Swing Yarder

An excavator-based yarding machine with a winch, called SWING YARDER, features an excellent controllability and high mobility. It also ensures easy operation without requiring any sub-wire ropes and skylines, thus enabling great improvement of job efficiency in timber yarding.

■ **Excellent productivity**

- Dual hydraulic speed system to reduce cycle time (WA320-WA900, except WA320-3 CUSTOM, WA800-3)
- VOHS (Variable Output Hydraulic System) to reduce cycle time (WA1200)
- High capacity engine with power to spare
The powerful Komatsu engine provides fuel-efficient operation.
- High breakout force
Z-bar loader linkages are made of high-tensile-strength steel for maximum rigidity and powerful excavation.

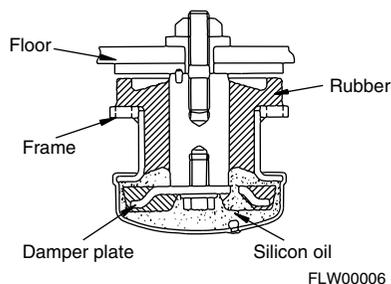

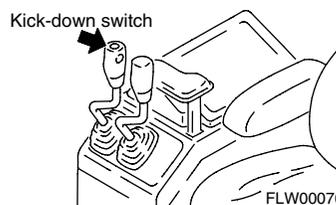

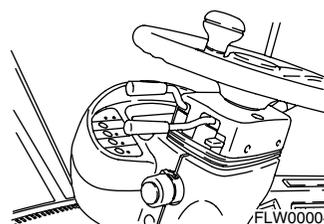

- Modulated clutch allows for selection of drive force and travel speed according to type of work. (WA1200)

■ **Easy & comfortable operation**

- Light-touch operations
Electrically controlled transmission enables light fingertip control of all direction/gear shifting.
- Use of PPC work equipment control valve
- Faster pile-penetration & scooping
Kick-down switch on the boom control lever facilitates material scooping operation.
- Tiltable steering column & one-glance monitor
Tiltable steering wheel and adjustable seat provide operator comfort and efficiency.
- Low vibration & noise
Komatsu viscous damping mounts reduce unpleasant vibration and noise.

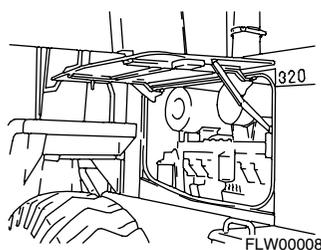

- Easy-to-use with organ-type brake pedal
- Switches centralized in front of operator
- Quick glow automatic preheating system employed
- AJSS (Advanced Joystick Steering System) with light, short strokes for perfect steering accuracy. (WA1200)

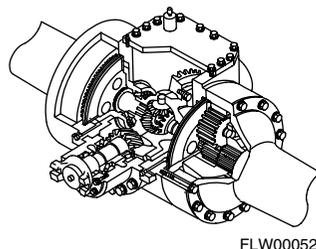

■ Easy maintenance and safety

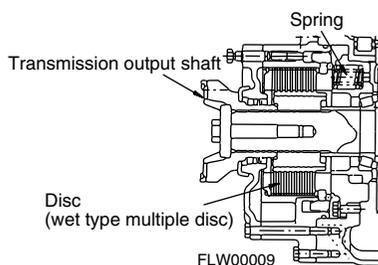

- Gull-wing type side cover
Gull-wing engine side covers facilitate engine access for easy check/replacement of engine oil or filters. (WA320-WA470)

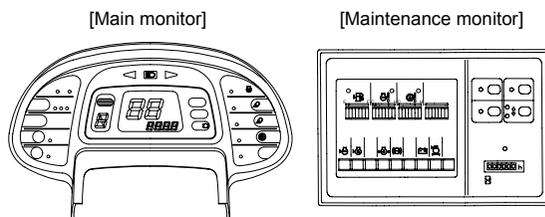

- Fully-sealed wet disc brake
Adjustment-free wet disc brakes ensure braking even on muddy terrain. They are sealed to stay free of dirt and other abrasive contaminants.

- Wet disc type parking brake
The parking brake prevents the entry of dirt or dust and reduced wear to make the parking brake maintenance free.

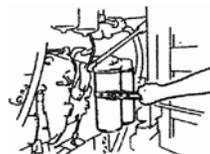

- Electric display panel one unit with steering column
The main monitor and the maintenance monitor (EDIMOS II) are neatly arranged on the instrument panel for a quick, clear reading of machine functions at all times.

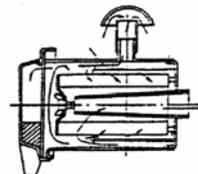

- TMS (Total Management System) & CGC (Color Graphic Console)
TMS connects each controller and sensor to the VHMS (Vehicle Health Monitoring System) controller and displays the condition and management information of the vehicle on the CGC. (WA1200)

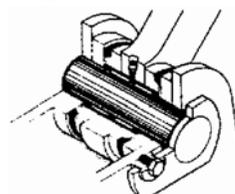

- Spin-on type full-flow engine oil filters and fuel filters for easy element replacement.

- Dry type air cleaner with automatic dust evacuator for longer element service.

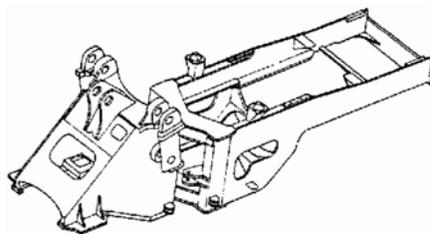

- Sealed loader linkage pins with dust seals and cord rings extend greasing intervals.

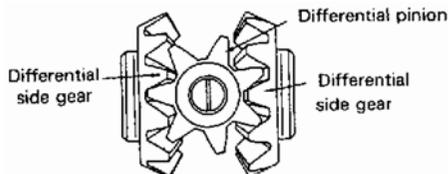

■ Dependable and high-performance components

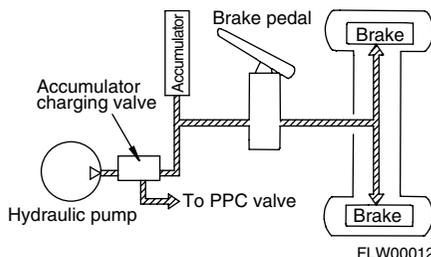

- High-rigidity frames
Front and rear frames are made as one larger loader class to provide high rigidity for the power train and loader equipment.
The high-rigidity frames, together with the reinforced loader linkage for resist loading stress and shock.

- Torque proportioning differential installed
Torque proportioning differentials minimize slippage, improve traction and increase the service life of tires. (WA320-WA470)

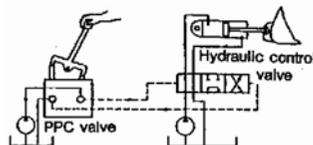

- Dependable braking system
Two independent fully hydraulic brake lines are used for the brake control system.

- High-quality paint
Most exterior plates are treated with a cation electro-deposition undercoat and melamine baked final paint for rust resistance and longer service life.
In addition, some exterior components employ resin.

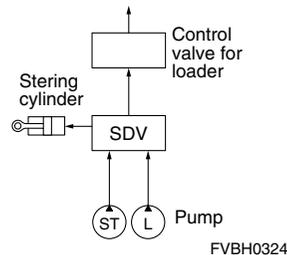

- Proportional pressure control (PPC): Little effort is required to operate the bucket and boom control levers, assuring smooth, responsive bucket/boom action.
[WA320 and over except WA320-3 CUSTOM]

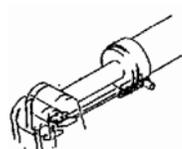

- Tilttable steering wheel and fully adjustable suspension seat provide maximum operator comfort.
[WA320 and over]

- Hydraulic power steering system guarantees light-touch steering at all times.
- High machine stability is assured by a center-pin-supported rear axle and large oscillation angle that keep the machine level even on the roughest surfaces.

- Automatic bucket positioner assures accurate bucket positioning.

- Boom kick out device facilitates repeated dig-load operations.
[WA320 and over]

- Tire saver controls tire slip and lengthens tire life.
[WA1200]

■ High productivity and low fuel consumption

• Dual-mode engine power select system

- This wheel loader offers two selectable operating modes-Normal and Power.
 - **E mode:** This mode provides maximum fuel efficiency for most of general loading.
 - **P mode:** This mode provides maximum power output for hard digging operation or hill climb.

(WA380-6, WA430-5(-6), WA470-5(-6), WA500-6 and WA600-6)

• Automatic transmission mode select system

This operator controlled system allows the operator to select manual shifting or three levels of automatic shifting (low, medium, and high).

(WA380-6, WA430-5(-6), WA470-5(-6), WA500-6 and WA600-6)

• New dual-speed hydraulic system

Komatsu's dual-speed hydraulic system increases operational efficiency by matching the hydraulic demands to work conditions.

(Except WA150 – WA320, WA380-6, WA500-6 and WA600-6)

• Maximum dumping clearance and reach

The long lift arms provide high dumping clearances and maximum dumping reach. The operator can even level loads on the body of a dump truck easily and efficiently.

• Long wheelbase/articulation angle of 40°

The widest tread in class and the long wheelbase provide improved machine stability in both longitudinal and lateral directions. Since the articulation angle is 40°, the operator can work efficiently even in the tightest job sites.

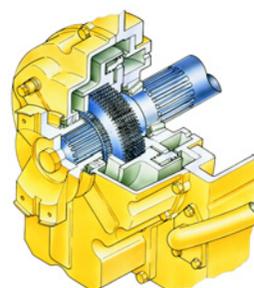

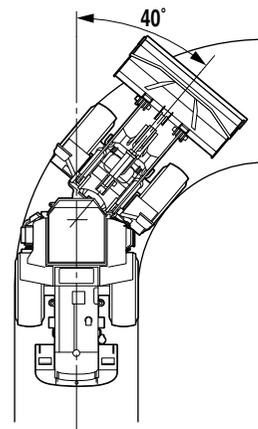

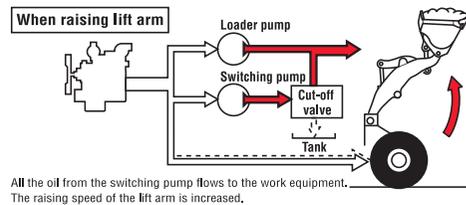

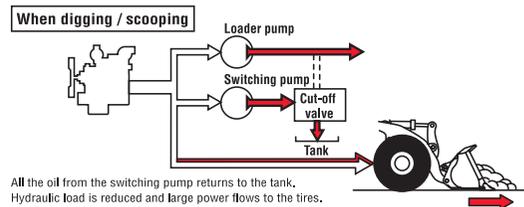

• Low fuel consumption

The fuel consumption is reduced greatly because of the low-noise, high-torque engine and the large-capacity torque converter with maximum efficiency in the low-speed range.

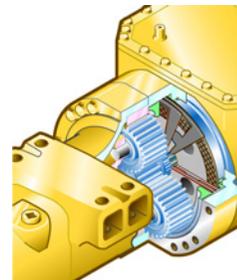

■ Increased reliability

- **Wet multi-disc brakes and fully hydraulic braking system** mean lower maintenance costs and higher reliability. Wet disc brakes are fully sealed. Contaminants are kept out, reducing wear and resulting maintenance.

Brakes require no adjustments for wear, meaning even lower maintenance. The new parking brake is also an adjustment-free, wet multi-disc for high reliability and long life.

Wet multi-disc brake

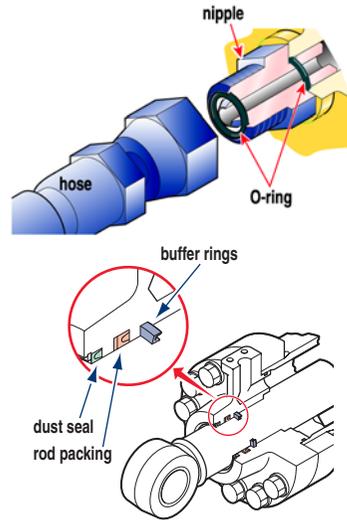

Wet type disc parking brake

- **Hi-rigidity frames**

The front and rear frames have high rigidity to bear twisting and bending loads applied repeatedly to the loader body.

- **Flat face-to-face O-ring seals**

Flat face-to-face O-ring seals are used to securely seal all hydraulic hose connections and to prevent oil leakage. In addition, buffer rings are installed to the head side of the all-hydraulic cylinders to lower the load on the rod seals and maximize the reliability.

- **Komatsu components**

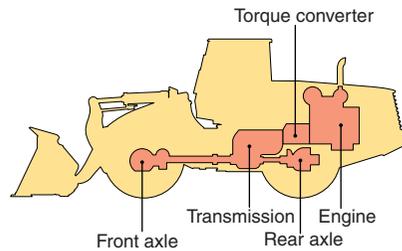

Komatsu manufactures the engine, torque converter, transmission, hydraulic units, electric parts, and even each bolt on this wheel loader.

- **Cathion Electrodeposition primer paint/ powder coating final paint**

Cathion electrodeposition paint is applied as a primer paint and powder coating is applied as topcoat to the exterior metal sheet parts.

- **Sealed DT connectors**

Main harnesses and controller connectors are equipped with sealed DT connectors providing high reliability, water resistance and dust resistance.

- **Easy maintenance**

- **EMMS (Equipment Management Monitoring System)**

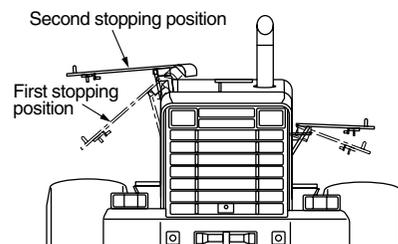

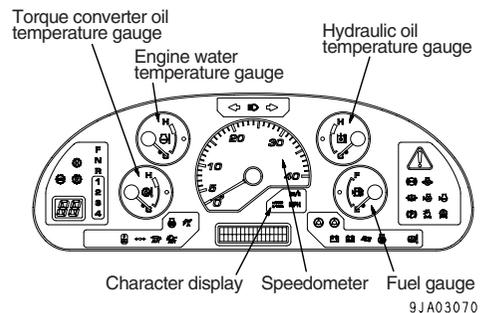

Monitor is mounted in front of the operator for easy view, allowing the operator to easily check gauges and warning lights.

- **Reversible cooling fan and swing-out cooler elements**

If the machine is operating in adverse conditions, the operator can reserve the hydraulic cooling fan from inside the cab by turning on a switch on the control panel.

- **Gull-wing type engine side doors open wide**

The operator can open and close each gull-wing type engine side door easily with the assistance of a gas spring to perform daily service checks from the ground.

FVW00925

■ Easy & comfortable operation

• Automatic transmission with ECMV

Automatic transmission with ECMV automatically selects the proper gear speed based on travel speed, engine speed, and other travel conditions. The ECMV (Electronically Controlled Modulation Valve) system engages the clutch smoothly to prevent lags and shocks when shifting. This system provides efficient machine operation and a comfortable ride.

• Kick-down switch

With the touch of a finger, the kick-down switch automatically down shifts from second to first when beginning the digging cycle.

• Electronically controlled transmission lever

Easy shifting and directional changes with Komatsu two-lever electronic shifting. Change direction or shift gears with a touch of the fingers without removing the shifting hand from the steering wheel.

• Variable transmission cut-off

The operator can adjust the transmission cut-off connected to the left brake pedal with the switch near the operator's seat to set the brake/cut-off point for easier operation and higher operating performance in variable operating conditions.

- High cut-off pressure for digging operations.
- Low cut-off pressure for truck-loading operations.

• Fingertip work equipment control lever

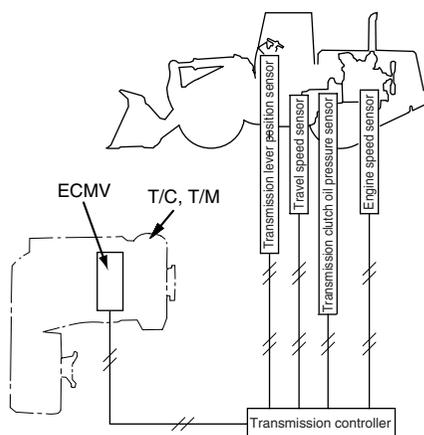

New PPC control levers are used for the work equipment. The operator can easily operate the work equipment with fingertip control, reducing operator fatigue and increasing controllability.

• Low-noise design

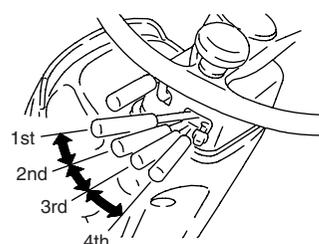

The large cab is mounted with Komatsu's unique ROPS/FOPS viscous mounts. The low-noise engine, hydraulically driven fan, and hydraulic pumps are mounted with rubber cushions, and the cab sealing is improved to provide a quiet, low-vibration, dustproof with pressurizing, and comfortable operating environment.

• Rear-hinged full open cab door

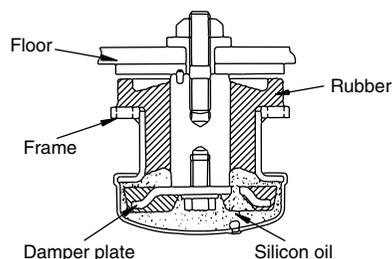

The cab door hinges are installed to the rear side of the cab providing a large opening angle for the operator to enter and exit.

9JM00799

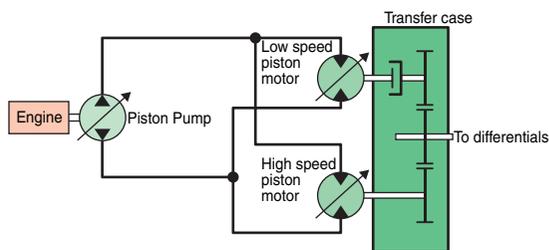

FLW00006

■ Electronically-Controlled HST Using a 1-Pump, 2-Motor System

- The 1-pump, 2-motor system allows for high-efficiency and high tractive effort. Engine power is transmitted hydraulically to transfer case, then manually out to the differentials and out to the four driving wheels.
- HST provides quick travel response and aggressive drive into the pile. The variable displacement system automatically adjusts to the tractive effort demand to provide maximum power and efficiency.
- Full auto-shifting eliminates any gear shifting and kick-down operation to allow the operator to concentrate on digging and loading.
- When high drive torque is needed for digging, climbing or initiating movement, the pump feeds both motors. This combination makes the loader very aggressive and quick.
- Under deceleration, the HST system acts as a dynamic brake on the mechanical drive system. The dynamic brake can hold the loader in position on most workable slopes. This can be an advantage in stockpiling and ramp loading.

(WA150, WA200/PT, WA250/PT, WA320)

- As the machine moves and gains ground speed, the torque demand decreases and the low speed motor is effectively removed from the drive system by a clutch. At this point, the flow is going to the high-speed motor and the low-speed motor is not causing a drag on the system.
- An inching pedal gives the operator excellent simultaneous control of his travel and equipment hydraulic speeds. By depressing the inching pedal, drive pump flow to the motors will decrease, reducing ground speed and allowing the operator to use his accelerator to increase flow to his equipment hydraulics. Depressing the inching pedal further will activate the service brakes.

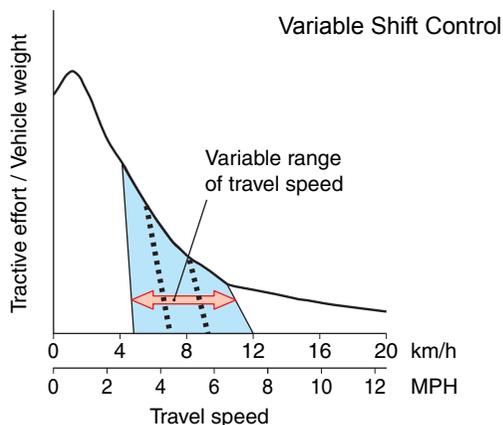

■ Electronically-Controlled HST with Variable Shift Control System

The operator can choose between first, second, third or fourth maximum speeds by dialing the speed range selector switch.

The variable shift switch allows the operator to adjust his machine speed in confined v-loading applications.

(WA150, WA200/PT, WA250/PT, WA320)

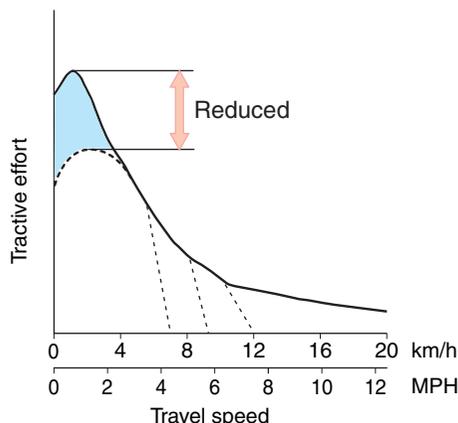

■ Traction Control System

In limited traction situations where the operator would like to avoid tire slippage (such as sandy or wet surface operations), he can automatically reduce slippage by activating the traction control feature. Putting the traction control switch in the "ON" position limits the maximum amount of tractive effort.

(WA150, WA200/PT, WA250/PT, WA320-5(-6))

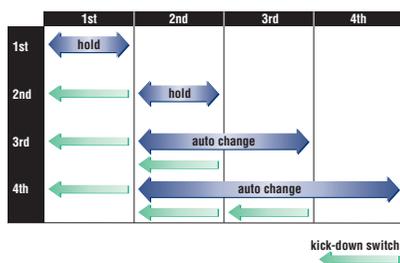

■ Overrun Prevention System

When the machine descends a slope of six degrees or less, maximum travel speed is automatically restricted to specified speed, for safety protection against damage of power train components and brakes by sensing the travel speed and controlling the discharge amount of the HST pump and motor. When the machine descends a steep slope and the travel speed reaches specified speed, the caution lamp lights up to inform the operator to reduce the travel speed.

(WA150, WA200/PT, WA250/PT, WA320-5(-6))

■ Automatic Transmission with ECMV

Automatic transmission with ECMV automatically selects the proper gear speed based on travel speed, engine speed, and other travel conditions. The ECMV (Electronically Controlled Modulation Valve) system engages the clutch smoothly to prevent lags and shocks when shifting. This system provides efficient machine operation and a comfortable ride.

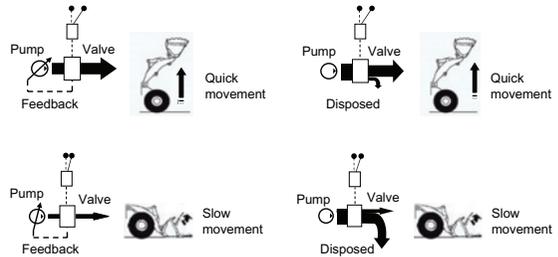

- Kick-down switch: Consider this valuable feature for added productivity. With the touch of a finger, the kick-down switch automatically downshifts from second to first when beginning the digging cycle. It automatically up shifts from first to second when the direction control lever is placed in reverse. This results in increased rim pull for better bucket penetration and reduced cycle times for higher productivity.
- Hold switch: Auto shift is selected and if the operator turns on this switch when the lever is at the 3rd or 4th gear speed position, the transmission is fixed to that gear speed.

(WA380-6, WA430-5(-6), WA470-5(-6), WA480-5(-6), WA500-6, WA600-6)

■ Variable displacement piston pump & CLSS

New design variable displacement piston pump combined with the Closed-center Load Sensing System delivers hydraulic flow just as the job requires preventing wasted hydraulic pressure. Minimized waste loss contributes to better fuel economy.

- **New Variable Displacement Piston Pump:** The pump delivers only necessary amounts minimizing waste loss.
- **Fixed Displacement Piston Pump:** The pump delivers the maximum amount at any time and the unused flow is disposed.

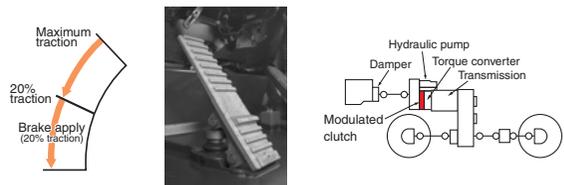

(WA380-6 through WA600-6)

■ Modulated Clutch System

The Modulated Clutch System controls the tractive effort with left brake pedal from 100% to 20% of the converter output torque.

(WA600-6)

■ Lock-up Torque Converter

The Komatsu designed lock-up torque converter provides increased production efficiency, reduced cycle times and optimum fuel savings in load & carry or hill-climb operations.

(WA600-6, option for WA500-6)

■ Ecology Features

ecot 3 (EPA Tier 3, EU Stage 3A certified engine)

Komatsu develops and produces all major components, such as engines, electronics and hydraulic components in house.

With this "Komatsu Technology", and adding customer feedback, Komatsu is achieving great advancements in technology.

To achieve high levels of productivity and ecology, Komatsu developed the main components with an advanced control system.

The result is a new generation of high performance and environment friendly machines.

(WA200-6 through WA600-6)

■ Variable Transmission Cut-off

The operator can adjust the transmission cut-off connected to the left brake pedal with the switch near the operator's seat to set the brake/cut-off point for easier operation and higher operating performance in variable operating conditions.

- High cut-off pressure for digging operations.
- Low cut-off pressure for truck-loading operations.

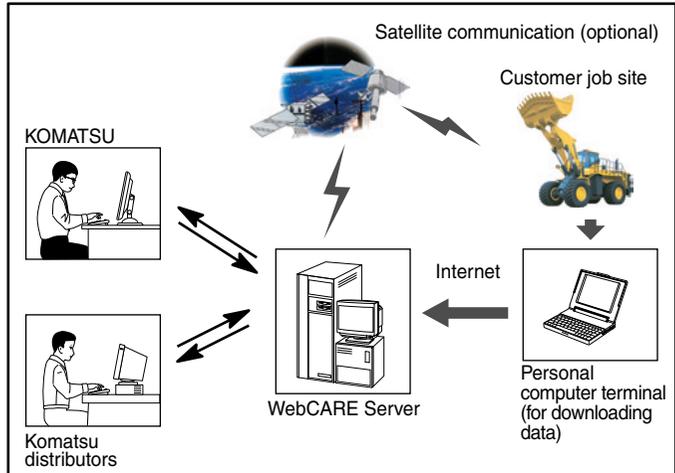

(WA380-6, WA430-5, WA470-5, WA480-5, A500-6)

■ Fuel efficient electronic controlled engine

The engine is EPA Tier 3 and EU Stage 3A emission regulation certified. The engine is turbocharged and features Common Rail Injection system and air-to-air aftercooling to maximize power, fuel efficiency and emission compliance. To minimize noise and vibration, the engine is mounted to the main frame with rubber cushions.

VHMS (Vehicle Health Monitoring System) (Option for WA600-6)

VHMS controller monitors the health conditions of major components, enables remote analysis of the machine and its operation. This process is supported by the Komatsu distributors, factory and design team. This contributes to reduced repair costs and to maintaining maximum availability.

■ Merits of Using VHMS

Diagnosis

- Machine health information that used to take approximately 1 hour to be measured can now be downloaded by personal computer in approximately 10 minutes, shortening the vehicle's down time.
- Furthermore, if the satellite communications function is equipped, the machine information can be gathered without stopping the vehicle at all. (Not available in some regions.)

Recommendation

- An appropriate recommendation can be made by viewing these data over the Internet.
 - Proper driving methods
 - Formulation of maintenance plans in advance that suit the customer's production schedule.

Customer's Benefit

- Sudden break down can be prevented through utilization of data trend (change over time).
- Ascertaining the facts and searching for the cause of the breakdown are simplified, thus enabling problems to be resolved quickly.
- Down time can be shortened by the systematic use of Reman components.
- Machine life can be extended significantly by proper operation and proper maintenance.

- All dimensions, weights and performance values based on SAE J732c and J742b standards.
- Static tipping load and operating weight shown include lubricant, coolant, full fuel tank, ROPS cab, and operator.
- Machine stability and operating weight are affected by counterweight, tire size and other attachments.
Apply the following weight changes to operating weight and static tipping load.

Weight Changes

	Change in operating weight kg (lb)	Change in tipping load kg (lb)	
		Straight	Full turn
Remove ROPS cab	-500 (-1100)	-470 (-1040)	-410 (-900)
Install ROPS canopy 320 kg (710 lb)	-180 (-400)	-170 (-370)	-150 (-330)
Install steel cab 310 kg (680 lb)	-190 (-420)	-180 (-400)	-160 (-350)
Install additional counterweight	+280 (+620)	+530 (+1170)	+460 (+1010)

- All dimensions, weights and performance values based on SAE J-732c and J-742b standards.
- Static tipping load and operating weight shown include lubricant, coolant, full fuel tank, steel cab, ROPS cab and operator.
- Machine stability and operating weight are affected by counterweight, tire size and other attachments.
Apply the following weight changes to operating weight and static tipping load.

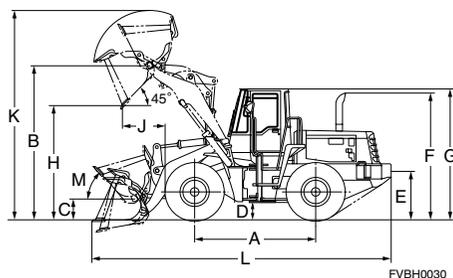

Weight Changes

	Change in operating weight kg (lb)	Change in tipping load kg (lb)	
		Straight	Full turn
Remove ROPS cab	-670 (-1,475)	-610 (-1,345)	-590 (-1,300)
Install additional counterweight 325 kg (715 lb)	+325 (+715)	+830 (+1,835)	+690 (+1,520)

- All dimensions, weights and performance values based on SAE J-732c and J-742b standards.
- Static tipping load and operating weight shown include lubricant, coolant, full fuel tank, steel cab, ROPS cab and operator.
- Machine stability and operating weight are affected by counterweight, tire size and other attachments.
Apply the following weight changes to operating weight and static tipping load.

Weight Changes

	Change in operating weight kg (lb)	Change in tipping load kg (lb)	
		Straight	Full turn
Remove ROPS cab	-670 (-1,475)	-600 (-1,325)	-580 (-1,280)
Install additional counterweight	+400 (+885)	+1010 (+2,220)	+845 (+1,865)

USE OF TRAVEL TIME CHARTS

The following explanation applies to travel time charts for Wheel Loaders.

1) How to read graph:

The vertical axis indicates the distance and the horizontal axis indicates the time. First, check the travel resistance of the jobsite. Then, obtain the intersection point of the resistance line and the distance. The value of the horizontal axis at this point is the travel time. This graph does not include the acceleration time.

2) Explanation of travel resistance:

The item indicated by percentage is the travel resistance. The travel resistance is the total of the grade resistance and rolling resistance. The rolling resistance varies with the road condition. Set it to 3.3% usually.

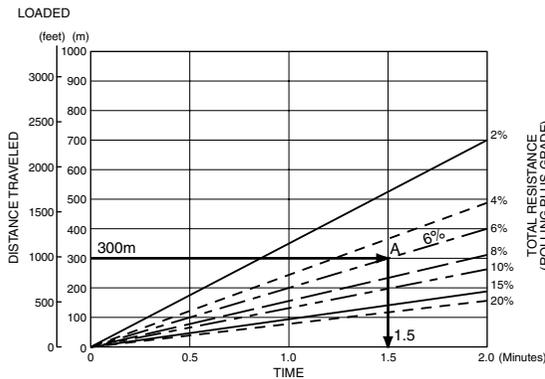

3) Empty and loaded curves:

The empty curve indicates the weight and travel curve of the machine of the ordinary specification. The loaded curve indicates the total of the weight of the empty machine and the rated load.

Example:

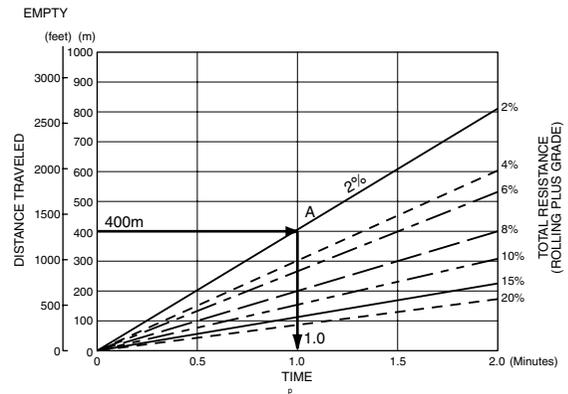

Haul...

Using the graph for the Loaded machine, read from the Travel Distance (one way) scale at 300 m (980 feet) across to the 6% total resistance line (point A). From (point A) read down to the Travel Time (one way) scale to determine haul time = 1.5 minutes.

Return...

Using the graph for the Empty machine, read from the Travel Distance (one way) scale at 400 m (1310 feet) across to the 2% total resistance line (point A). From (point A) read down to the Travel Time (one way) scale to determine haul time = 1.0 minutes.

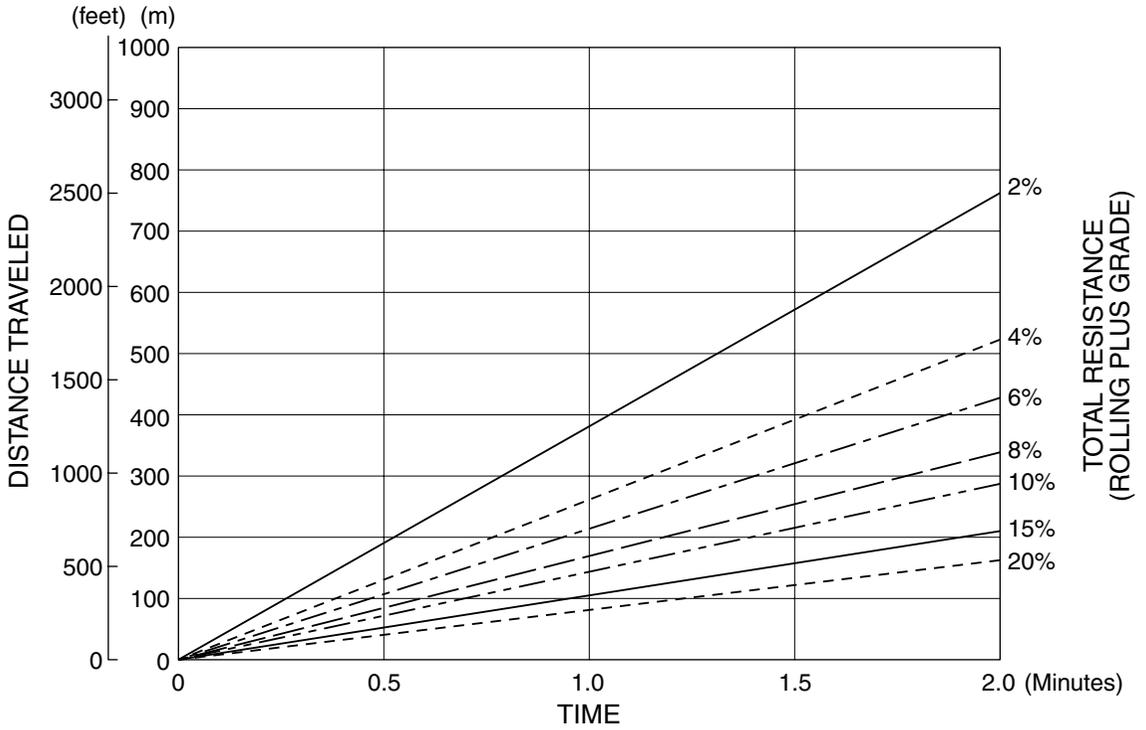

NOTE: Curves assume use of highest operating speed attainable. It is important to consult the tire manufacturer on Ton-Mile-Per-Hour ratings and pressure recommendations.

1. OPERATING WEIGHT

The total mass in kilograms (pounds) of the machine as specified and fully serviced, including a full fuel tank and 80 kg (175 lb) operator.

2. BUCKET CAPACITY (BY SAE)

The bucket capacity of wheel loaders is calculated as follows:

The struck capacity is defined as the volume of material retained in the bucket after a heaped load is struck by drawing a straight edge across the width of bucket with one end of the straight edge resting on the cutting edge and the other end resting on the uppermost portion of the bucket back sheet or spill guard. The struck capacity (V_s) can be expressed by the following equation:

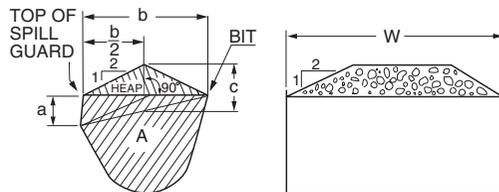

$$V_s = AW - \frac{2}{3} a^2b$$

A = cross sectional area at the center of the bucket, mm^2 (in^2).

W = average inside width of the bucket, mm (in.).

a = height of the spill guard at the center of the bucket normal to the strike line, mm (in.).

b = length of opening at the center of the bucket, mm (in.).

FVBH0009

Using the 2 : 1 angle of repose of the heaped material, the heaped capacity (V_h) is expressed as follow:

$$V_h = V_s + \frac{b^2W}{8} - \frac{b^2}{6} (a+c)$$

Where c is the length on a normal to the strike line. On one end it is terminated by the assumed crest of the material.

On the other end it is terminated by the intersection with a line from the bit or cutting edge tip to the base of the spill guard.

This method applies primarily to irregular buckets having parallel sides and a cutting edge parallel to the edge of the spill guard or back sheet. Moderately clipped spill guard corners will introduce no appreciable errors.

3. BUCKET LOAD

The bucket load should not exceed 50% of the TIPPING LOAD for wheel loaders or 35% of the TIPPING LOAD for crawler loaders, and will be considered as operating under the following conditions:

1. Lifting ability of the machine in all bucket positions to be no less than the specified operating load.
2. Bucket attachment of specified size and type.
3. Maximum travel speed of 6 km/h (3.7 mph).
4. Operating surface.

(a) Shall be hard, moderately smooth and level for wheel loaders.

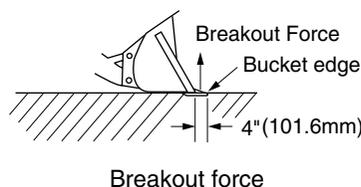

(b) General operating conditions of crawler loaders are such that they normally are not operating on hard, moderately smooth level surface.

For this reason, the rating on crawler loaders is set at the lower figure of 35%.

4. BREAKOUT FORCE

Breakout force in kilograms (and kilo-Newton or pounds) is the maximum sustained vertical upward force exerted 100 mm (4 in) behind the tip of the bucket cutting edge and is achieved through the ability to lift and/or roll-back the bucket about the specified pivot point under the following conditions:

- (a) Machine with transmission in neutral.
- (b) All brakes released.
- (c) Unit at standard operating weight, rear of machine not tied down.

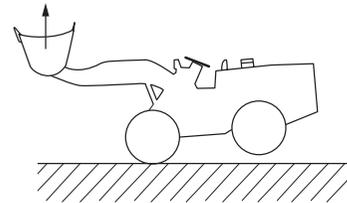

FVBH0010

- (d) Bottom of cutting edge parallel to and not more than 25 mm (1 in) above or below the ground line.
- (e) When bucket circuit is used, the pivot point must be specified as the bucket hinge pin, and the unit blocked under the bucket hinge pin pivot point in order to minimize linkage movement.
- (f) When the lift circuit is used, the pivot point must be specified as the lift arm hinge pin.
Wheel loaders shall have front axle blocked to eliminate change in position of pivot pins due to tire deflection.
- (g) If both circuits are used simultaneously, the dominating pivot point listed in (e) or (f) must be specified.
- (h) If the circuit used causes the rear of the machine to leave the ground then the vertical force value required to raise the rear of the machine is the breakout force.
- (i) For irregular shaped buckets, the tip of the bucket cutting edge, referred to above shall mean the farthest forward point of the cutting edge.

5. STATIC TIPPING LOAD

The minimum mass in kilograms (pounds) at the center of gravity of the SAE rated load in the bucket which will rotate the machine to a point where, on the crawler units, the front track rollers are clear of the track and, on wheel loaders, the rear wheels are clear of the ground under the following conditions:

- (a) Maximum bucket rollback.
- (b) Center of gravity of load at the maximum forward position in the raising cycle.
- (c) Machine at operating weight and equipment as specified.
Articulated steer loader shall be in full turn position (specify angle).

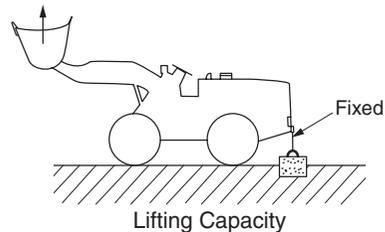

Tipping Load

FVBH0011

6. LIFTING CAPACITY

The maximum mass in kilograms (pounds) at the center of gravity of SAE rated load in the bucket that can be lifted at a specified height with the bucket positioned to retain maximum load under the following conditions:

- (a) Machine with rear end tied down.
- (b) Machine at operating weight and equipment as specified.

Lifting Capacity

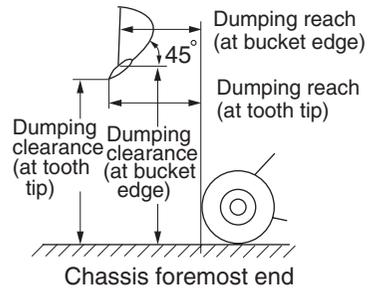

FVBH0012

7. HYDRAULIC CYCLE TIMES

- Raising Time — The time in seconds required to raise the bucket, rolled back, from the ground level position to full height with the specified SAE operating load.
- Lowering time — The time in seconds required to lower the empty bucket from the full height to a level position on the ground.
- Dump Time — The time in seconds required to move the bucket from the load carrying position at maximum height to the full dump position while dumping the specified SAE operating load.

8. DUMPING CLEARANCE AND REACH

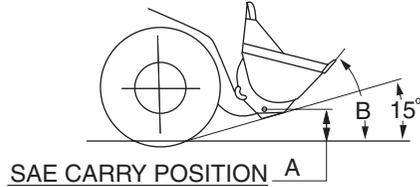

- Dumping clearance — The vertical distance in millimeters (inches) from the ground to the lowest point of the cutting edge with the bucket hinge pin at maximum height and the bucket at a 45 degree dump angle. If the dump angle is less than 45 degree, specify the angle.
- Dumping reach — The horizontal distance in millimeters (inches) from the foremost point on the machine (including tires, tracks, or loader frames) to the rearmost point of the bucket cutting edge with bucket hinge pin at maximum height and bucket at a 45 degree dump angle. If the dump angle is less than 45 degree, specify the angle.

FVBH0013

9. CARRY POSITION

The vertical distance from the ground in millimeters (inches) to the centerline of the bucket hinge pin, with the angle of approach at 15 degree.

- A: Carry height
- B: Mex tilt-back angle (At carry position)

1. General Purpose Bucket (Stockpile):

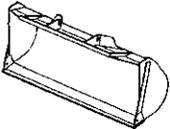

This bucket is used for loading stockpile products, such as crushed rock and construction materials.

2. General Purpose Bucket (Excavating):

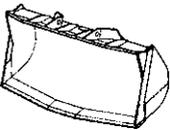

This bucket is used for excavating and loading blasted rock on rock crushing job sites, or for excavating natural ground. It has a flat-blade, straight cutting edge, and provides superior rigidity and wear resistance.

3. Light Material Bucket:

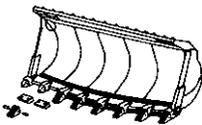

This bucket is used for loading materials with comparatively light specific gravity [below 1.2 t/m³ (2000 lb/cu.yd)], such as snow, fertilizer, and livestock feed. It is based on the general purpose bucket, with a lengthened cutting edge and width to give increased capacity. There is also a large capacity coal bucket for loading loose coal with a specific gravity of below 0.89 t/m³ (1500 lb/cu.yd).

4. Spade-nose Rock Bucket (V-edge type):

This bucket is used for excavating and loading blasted rock on rock crushing job sites. It has a pointed cutting edge, and provides superior rigidity and wear resistance.

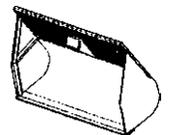

5. Heavy-duty Bucket:

This bucket is used for digging and loading blasted rock on rubble mounds and rock crushing job sites. It has 1-class-larger teeth, and a large, thicker wear plate, large corner edge/side guard, and strengthened spill guard.

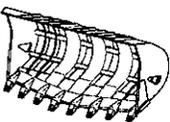

NOTE: When installing this bucket on machines other than the WA700 or WA800, to maintain the stability of the machine, please install an additional counterweight and an orifice (or retainer) for reducing the dumping shock of the bucket .

6. Chip Bucket:

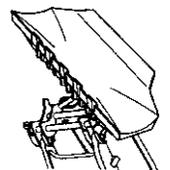

This is a large bucket used for loading loose materials with low specific gravity [below 0.55 t/m³ (930 lb/cu.yd)], such as chips and grain. The back and top are made of a wire mesh to reduce the weight. This bucket can demonstrate its power in bucket operations in the paper-manufacturing business and sawmills.

7. Skeleton Bucket:

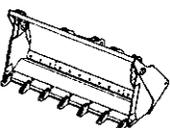

This bucket is used for digging and loading blasted rock on rubble mounds and rock crushing job sites. It has a lattice structure allows it to sift out soil and small rocks, thereby enabling it to select only the rock materials.

8. Side Dump Bucket:

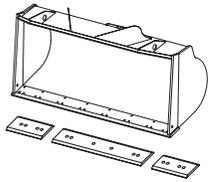

This bucket is capable of dumping its load to the front, to one side, or to both sides. These features make it the choice for jobs like tunneling work, road construction or snow clearance, where narrow operating areas restrict maneuverability.

9. Multi-purpose Bucket:

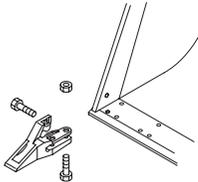

This is a versatile bucket that performs scraping, dozing, scooping and various other tasks in addition to excavating and loading jobs. It is especially suited to leveling work and material transport.

1. Bolt-on Cutting Edge:

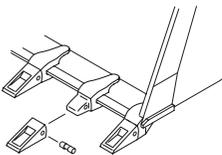

FVBH0217

This edge is made for use in loading loose sand and soil, or for loading stockpiled materials. It is bolted to the leading edge of general purpose buckets and may be detached and reversed. The cutting edges are manufactured from especially heat treated, high tension steel, and since they are reversible, both edges can be used. This effectively doubles their working life.

2. Bolt-on Teeth:

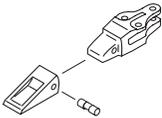

FVBH0218

These teeth are suitable for loading or excavation of piles of earth or sand, blasted rock, and jobs in the field that involve digging into the side of slopes. The special heat treated, tensile strength steel alloy used in their production assures that they will wear and have a long service life.

3. Tip-type Teeth:

FVBH0219

These teeth tips which are attached to an adapter that is welded or bolted to the bucket edge. This means that an interchangeable part, the tooth tip, absorbs most of the wear and protects the actual bucket edge. They give excellent performance when used to handle blasted rock, piles of earth and similarly heavy duty tasks.

FVBH0220

4. Tip-type Teeth (Long Life):

These teeth are larger than the normal teeth and provide an extended wear life, so they are suitable for use on job sites where there is rapid wear.

5. Tip-type Teeth (Sharp):

These teeth are sharper than the normal size teeth. They are suitable for work in handling large lumps of soft rock, or for grubbing work.

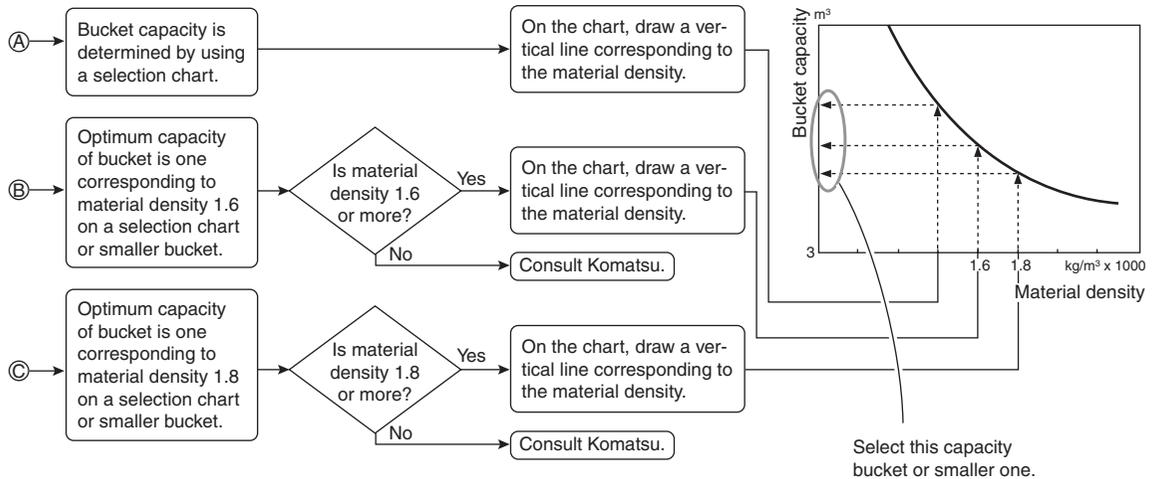

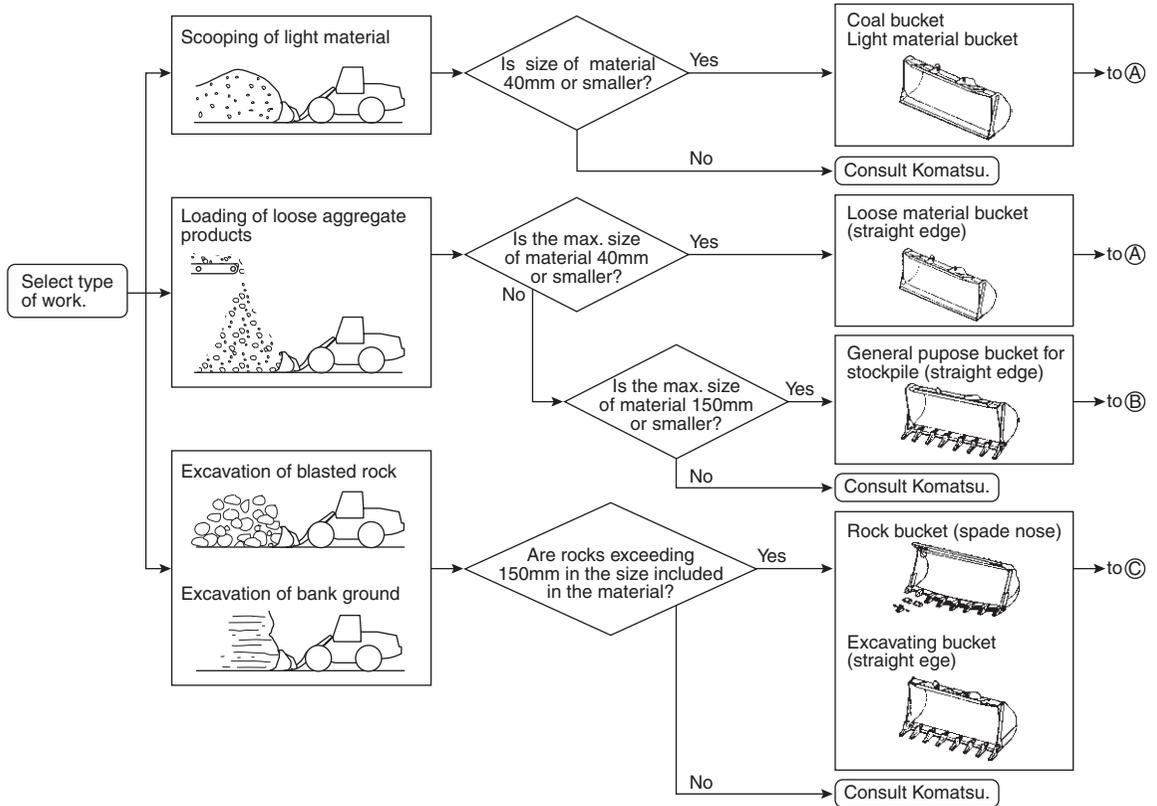

6. Bolt-on Teeth or Tip-type Teeth for Limestone:

These teeth are suitable for excavating or loading soft rock with a low silica content. (For example, limestone, shale or mudstone with low silica content.) These teeth are painted white.

NOTE: These teeth are not suitable for operation in rock with a high silica content, or with hard rocks. If they are used on such job sites, their life will be reduced. In such cases, use the normal teeth.

BUCKET SELECTION GUIDE FOR WHEEL LOADER

The optimum bucket type and capacity are determined in consideration of the "type of work" and the "operational stability".

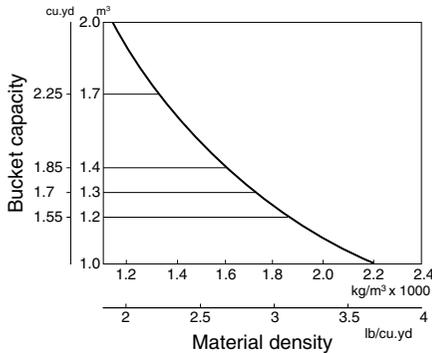

Bucket selection for wheel loader

The appropriate bucket capacity for each model is determined in relation with the density of material that the bucket carries.

The graphs are shown for the models WA120-3. The capacity of the currently available buckets for each model are shown there. Komatsu can develop other sizes of buckets according to these graphs, if it is requested through a distributor.

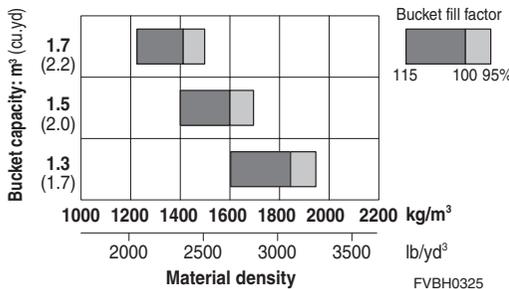

Bucket capacity in the graphs means SAE heaped capacity (Calculation method indicated on page 3A-130). The line in the graph shows the case when the bucket fill factor is 100%.

WA120-3

	Capacity Heaped m³ (cu.yd)	Struck m³ (cu.yd)
I General-purpose bucket with bolt-on cutting edge; (Loading and excavating of soil, sand and variety of other commonly handled materials)	1.4 (1.85)	1.2 (1.55)
II General-purpose bucket with teeth	1.3 (1.7)	1.1 (1.45)
III Excavating bucket with bolt-on cutting edges	1.2 (1.55)	1.0 (1.3)
IV Excavating bucket with teeth; (Loading and excavating of crushed rock and blasted rock)	1.2 (1.55)	1.0 (1.3)
V Light material bucket with bolt-on cutting edges; (A lighter-weight, large-capacity bucket)	1.7 (2.25)	1.5 (1.95)

DEFINITIONS

Standard / Heavy Duty - The load on the machine ranges from very little to moderate with some limited, "high load" use. Materials range from light and loose, well-shot, fracturable, to some medium, even heavy shot materials that break up into manageable sizes when excavated. Large slabs of rock do not fit in this category.

Extreme Service - The load on the machine is high, nearing the maximum capabilities of the machine. Materials are heavy un-shot rock or slabs that require the full force of the machine to break out.

- Log grapple

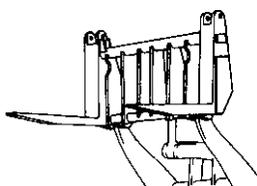

This is a special log attachment for use with logs ranging from small-diameter short logs to large-diameter long logs. Its shape enables it to grip the log well with little rolling shock, and it is designed so that the center of gravity of the log is close to the machine body. This enables the machine to maintain its stability when loading and hauling.

- Log-lumber grapple

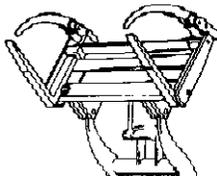

The log-lumber grapple is an all-round tool for log and lumber handling capable of dealing with lumber, long logs of large diameter or short logs of small diameter as well as lumber. However, forks of log-lumber grapple are fixed for strength so it is not suitable for use in forklift operations.

- Log-lumber fork

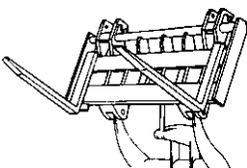

Log-lumber fork has the same features as log-lumber grapple. This attachment has no top clamps.

- Lumber grapple

The "L" type forks of the lumber fork permit handling of lumber and logs of smaller diameter and shorter length. Clearance between left and right forks is adjustable according to the materials being handled.

- Lumber fork

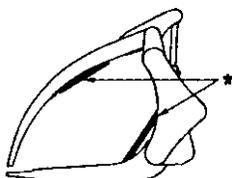

Lumber fork has the same features as lumber grapple. This attachment has no top clamps.

- Dumping fork

Useful for truck-loading pulpwood from stacks, and for gathering and loading pulpwood into stacks or onto trucks. Also usable in handling logs of smaller diameter and shorter length. A lighter, handy version of log handling attachments. It has no top clamp. It can load logs when tilted back to prevent them rolling over the fork.

- Pipe grapple

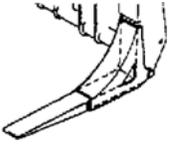

This is a log grapple with cushioning material to allow it to handle pipes and similar materials.

* : Cushioning material

Fork Equipment Features

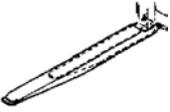

WHEEL LOADERS

- Rolling gusset

If a rolling gusset is installed to the log lumber fork or log lumber grapple, the rolling shock can be reduced when loading logs.

- Extension fork

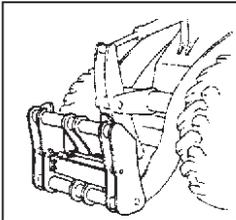

If an extension fork is installed to the lumber fork, the efficiency of handling light materials such as small diameter short logs can be improved.

- Multi-coupler

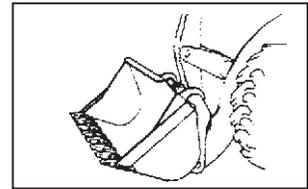

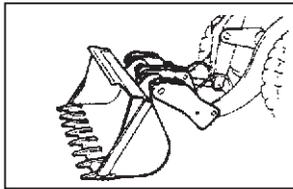

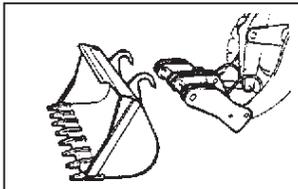

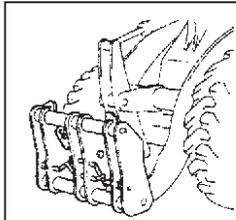

This is an attachment replacement device that makes it possible to speed up the replacement of attachments and reduce the burden on the operator.

It is possible to remove and install attachments to match the purpose of the work simply when sitting in the operator's seat, thereby greatly reducing time and labor.

Hydraulic type

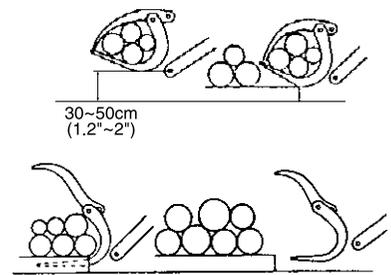

Mechanical type

A. Scooping

1. Forward the machine to insert forks under piled logs while watching fork tips.
2. Once logs are scooped by forks and tilted back fully, then close the arms.
3. Lift fork 30-50 cm above the ground to carry.

NOTE: Use both forks evenly to scoop and grapple the center of logs.

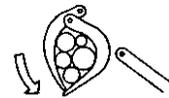

B. Loading work

1. Raise booms and forward the machine gradually to the destination while keeping the fork in a full backward tilt.
2. Open clamper arms and unload logs while slowly lowering forks.
After unloading logs, shift the fork control lever to the "tilt" position and the fork will return automatically to its preset position.
After closing the arms and reversing the machine, lower the booms.

NOTE: When dumping a full load of logs, lower engine revolutions to achieve gradual dumping.

Avoid sudden braking or steering with a full load of logs.
When loading onto trucks, be careful forks and logs do not hit the sticks mounted on the truck's body sides.

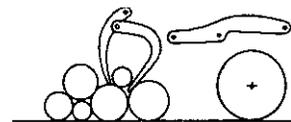

C. Log selection work (for loaders with log clamps)

1. Pick-up selection
 - 1) Open the arms, lower the fork and grab selected logs with fork tips.
 - 2) Pick up logs by tilting back the fork or raising the booms.

NOTE: When picking up a log with fork tips, adjust the tips so they grab the log tightly. More than half of the log's diameter should be grabbed to prevent slippage. Release the arm control lever after arm cylinder is relieved. Logs larger than 40 cm in diameter should be lifted one at a time. Use both forks evenly when grabbing the center of the log.

2. Pull-out selection
 - 1) Open the arms and dump them at 10°-15°, and grab the end of the selected log lengthwise using the fork tips.
 - 2) Reversing the machine to pull out selected log without steering.

NOTE: Do not lift chosen log higher than required.
Hold the log securely and close arm, then carry it.

D. Other operations

1. To push logs, open the clamp arms and push them with the inside of the fork, forming right angles with the logs.

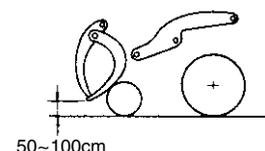

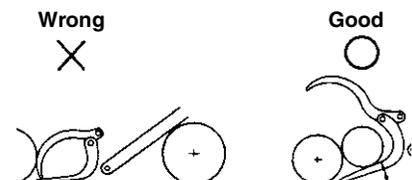

NOTE: The dumping angle should be within 20°.

Avoid pushing logs with the front of the closed clamp arms.

2. To retract logs, lower fork and raise fork tips 50-100 cm above the ground, then reverse the machine and retract the logs.

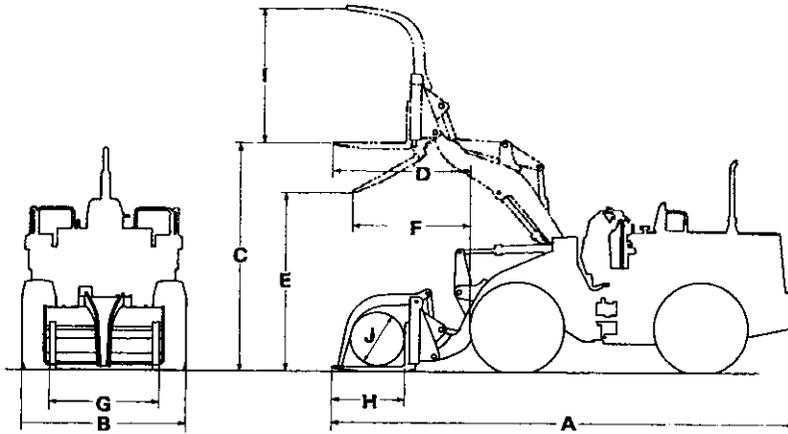

NOTE: Do not uproot tree roots with forks.

Dangerous operations, such as throwing grabbed logs for placement in the depth of loading site, should be conducted in open areas and only after the work site has been properly cleared. Do not conduct these operations where damage to the machine or other equipment is possible.

WA1200	20.0 (26.2)	Spade nose rock bucket with teeth	6285 (20'7")			3	4	5		
WA1200 High lift	18.0 (23.5)	Spade nose rock bucket with teeth	7005 (23'0")			3	4	6	7	9

Number of loading times is calculated based on following condition.

1. Calculate number of loading times from maximum payload of dump truck. Please see formula 1.
2. Calculate number of loading times from body capacity of dump truck. Please see formula 2.
3. Adopt lower number between formula 1 and formula 2.

Formula 1

Number of loading = Payload of truck (metric tonnes) / (Bucket capacity of loader (m³) × loose density × bucket factor)

Formula 2

Number of loading = Body capacity (cubic meter) / (Bucket capacity of loader (m³) × bucket factor)

We adopt following condition.

Density = 1.8 metric tonnes per cubic meter

Bucket factor = 1.0

Wheel Loader and Dump Truck Combination

WHEEL LOADERS

*1: Dumping clearance and loading height change depending on tires.

Above combination is determined by following method;

(1) Suitable loading times (n): 3-5 times

$$n = \frac{\text{Max. payload of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor} \times \text{Specific weight}}$$

or

$$n = \frac{\text{Heaped capacity of dump truck}}{\text{Bucket capacity} \times \text{Bucket fill factor}}$$

(2) Dumping clearance (DC)

Small and medium sized loaders: $DC \geq H$

Large sized loaders: $DC \geq H + (W/12)$

(3) Dumping reach (DR)

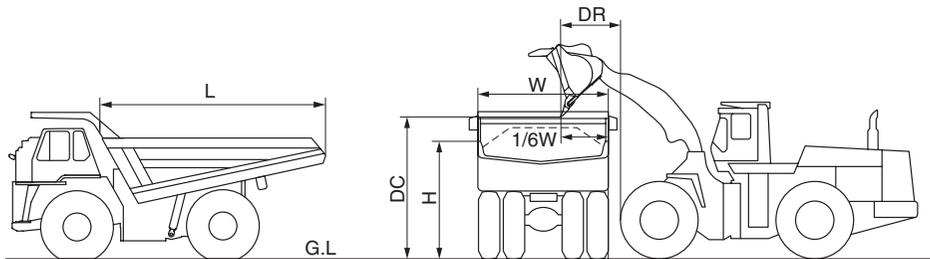

Small and medium sized loaders: $DR \geq (W/6) + 500 \text{ mm}$

Large sized loaders: $DC \geq W/3$

(4) Body length (L)

The dump truck's body length should be 1.3 to 1.7 times longer than the width of the bucket.

WHEEL DOZERS

CONTENTS

Features 3B-2
Specifications 3B-3
Dimensions 3B-4

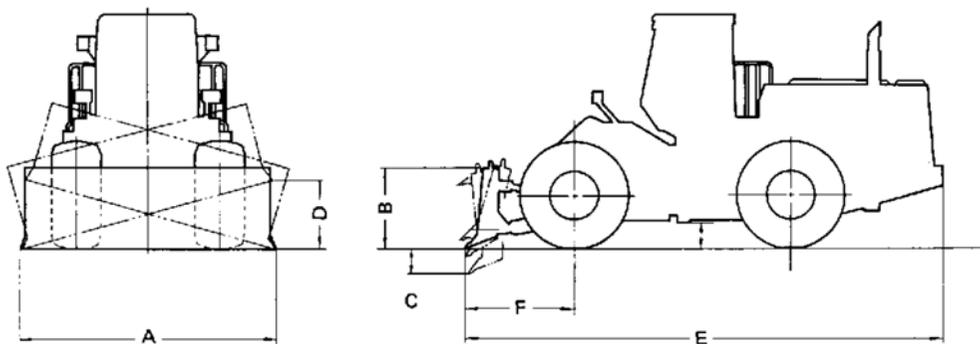

- Komatsu components throughout the machine assure years of reliability and high-performance service.
- Adjustment-free wet disc brakes for steady braking and extended service life.
- Electronic Display and Monitoring System for minimized maintenance.
- A large drawbar horsepower with fuel-efficient, powerful Komatsu diesel engine for high productivity and maneuverability.
- Fingertip control with Electrically Controlled Transmission.
- A tiltable steering wheel and fully adjustable suspension seat.

Ecology Features

ecot3 (EPA Tier 3, EU Stage 3A certified engine)

Komatsu develops and produces all major components, such as engines, electronics and hydraulic components in house.

With this “Komatsu Technology”, and adding customer feedback, Komatsu is achieving great advancements in technology.

To achieve high levels of productivity and ecology, Komatsu developed the main components with an advanced control system.

The result is a new generation of high performance and environment friendly machines.

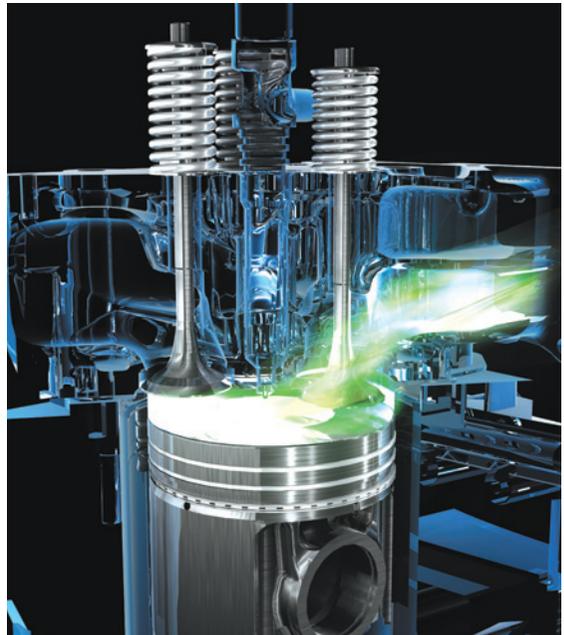

Fuel efficient electronic controlled engine

The engine is EPA Tier 3 and EU Stage 3A emission regulation certified. The engine is turbocharged and features Common Rail Injection System (CRI) and air-to-air aftercooling to maximize power, fuel efficiency and emission compliance.

To minimize noise and vibration, the engine is mounted to the main frame with rubber cushions.

(HD325/405-7, HD465/605-7E0)

■ High productivity

The result of total performance: High performance, minimum downtime, and easy operation

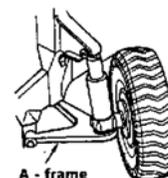

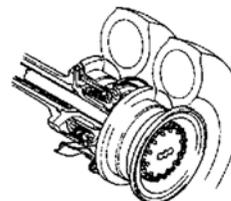

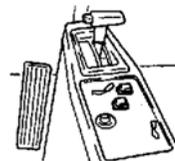

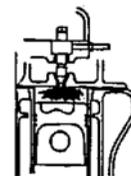

■ Dependable and high-performance components

- Komatsu diesel engine delivers high-output and direct injection system provides high fuel efficiency
- Full-automatic TORQFLOW transmission: A microcomputer built into the shift controller automatically selects the optimum gear position according to travel speed, load and road conditions assuring effort-free operation.
- High-performance, durable brakes: Sealed, oil-cooled, multiple-disc brakes on rear wheels are designed for extended operation. The large-capacity rear wheel brakes also act as retarders as a precaution against engine overrunning when descending steep inclines.
- High maneuverability: The MacPherson strut type front suspension system has a special A-frame between each wheel and the main frame. The wider space created between the front wheels and the main frame increases the turning angle of the wheels. The larger this turning angle, the smaller the turning radius of the truck.
- Extra sturdiness: Box-section, ladder type frame construction of high-tensile-strength steel plate and cast steel offer unfaltering durability for long service.
- Rigorous dump body design : The dump body is made of high-tensile-strength steel for excellent rigidity and reduced maintenance costs. The V-shape design also increases structural strength. The side and bottom plates of the dump section are reinforced with ribs for added strength.
- Instrument panel monitor: The functions of "User code display" to show machine troubles and remedy for them and "Service code display" to show the self-diagnosis result are added to the electronic display panel for easier control and higher availability of the machine.
- Maintenance monitor : The maintenance control function automatically checks key components before the truck is started. For even simpler and foolproof maintenance, filter and oil replacement times are suggested. Thus, failures are detected before they become critical.
[Except HD255]

■ Easy maintenance

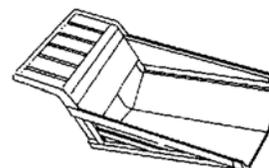

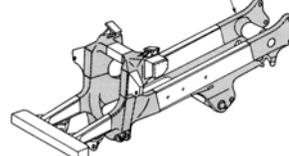

Greasing points have been centralized.

Fuel and engine oil filters are also located together on the right-hand remote mount for easy, remote inspection from the ground.

A - frame

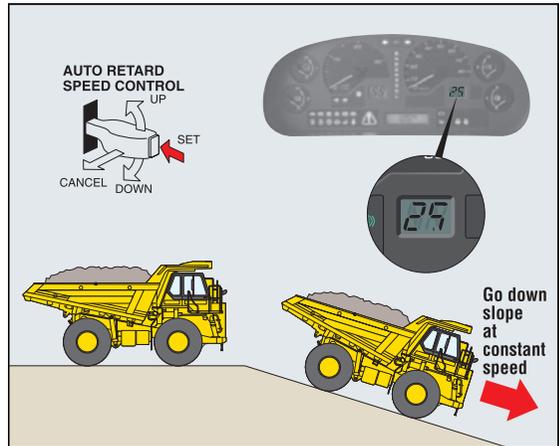

Painted part casting steel

Automatic Retard Speed Control (ARSC)

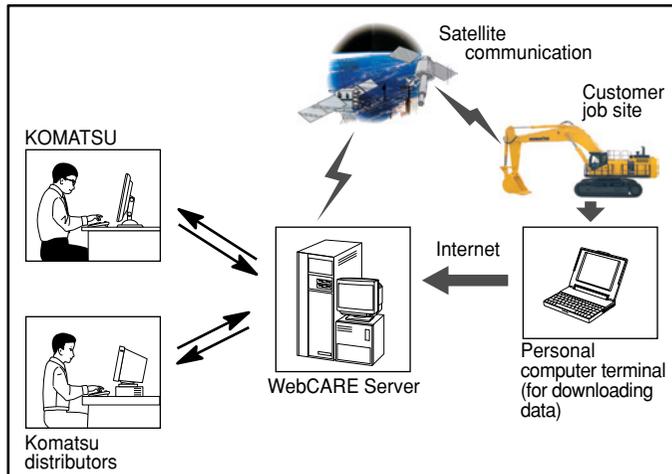

ARSC allows the operator to simply set the downhill travel speed and go down slopes at a constant speed. As a result, the operator can concentrate on steering. The speed can be set at increments of 1 km/h 0.6 MPH per click (±5 km/h 3.1 MPH of maximum speed adjustment) to match the optimum speed for the slope. Also, since the retarder cooling oil temperature is always monitored, the speed is automatically lowered.

(STD for HD465/605-7, 7E0, 7R, HD785-7)
(Option for HD325/405-7, 7R)

VHMS (Vehicle Health Monitoring System) (Option for HD465/605-7, 7E0, 7R, HD785-5, HD785-7)

VHMS controller monitors the health conditions of major components, enables remote analysis of the machine and its operation. This process is supported by the Komatsu distributors, factory and design team. This contributes to reduced repair costs and to maintaining maximum availability.

Merits of Using VHMS

Diagnosis

- Machine health information that used to take approximately 1 hour to be measured can now be downloaded by personal computer in approximately 10 minutes, shortening the vehicle's down time.
- Furthermore, if the satellite communications function is equipped, the machine information can be gathered without stopping the vehicle at all. (Not available in some regions.)

Recommendation

- An appropriate recommendation can be made by viewing these data over the Internet.
 - Proper driving methods
 - Formulation of maintenance plans in advance that suit the customer's production schedule.

Customer's Benefit

- Sudden break down can be prevented through utilization of data trend (change over time).
- Ascertaining the facts and searching for the cause of the breakdown are simplified, thus enabling problems to be resolved quickly.
- Down time can be shortened by the systematic use of Reman components.
- Machine life can be extended significantly by proper operation and proper maintenance.

How to use the travel performance curve

For assessing a vehicle's grade-ability, travel speed, rim pull, etc. First, draw a vertical line according to the vehicle's weight (A) and mark the point (B) corresponding to total resistance (the sum of rolling resistance and grade resistance). Next, draw a horizontal line from (B), then mark (C) where the line intersects the rim pull curve and read (E) for the rim pull. For travel speed (D), draw a vertical line downward from (C).

For instance, when traveling an 8% gradient and encountering a 5% rolling resistance, a vehicle with a 32 ton (35-U.S. ton) payload should have a rim pull of 8 tons (17,640 lb) and travel at a speed of 15 km/h (9.3 MPH) in forward 2nd gear.

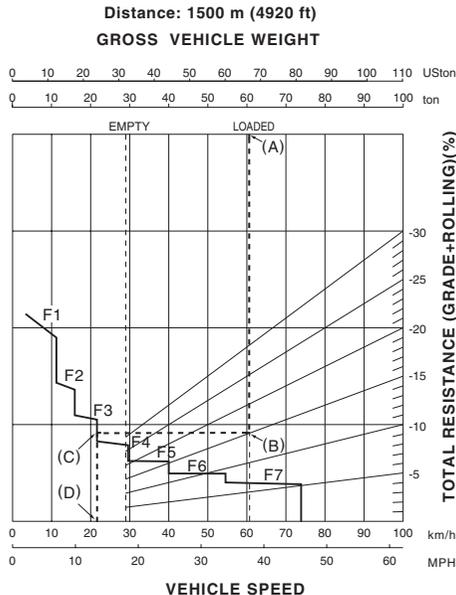

How to use the brake performance curve

These curves are provided for establishing the maximum speed and gearshift position for safe descent of a road with a given gradient at a given distance.

For example, let us assume the total resistance is -15% (gradient resistance -16% plus rolling resistance +1%) on the 1500m (4,920 ft) graph.

First, draw a vertical line from the total vehicle weight (A) so that it crosses the slanted line of -15% total resistance (B). From (B), draw a horizontal line to the left and it will cross the stair curve at (C). Finally, draw a vertical line from (C) and read (D) the maximum speed for driving safely down the slope.

In this case, a vehicle with a 32-ton payload should travel at approximately 22km/h (13.7MPH) with the F3 gear.

How to use this Performance Chart:

1. Calculate the Total Resistance (%).
Total Resistance (%) = Grade Resistance (%) + Rolling Resistance (%)
2. Calculate Rimpull Required.
Rimpull (lb or kg) = Gross vehicle Weight (lb or kg) × Total Resistance (%)
3. Locate the Point on the Rimpull Scale (lb or kg).
4. Read horizontally to the Performance Curve.
5. From the intersection at the curve, read vertically down to the speed scale (mph or km/h).

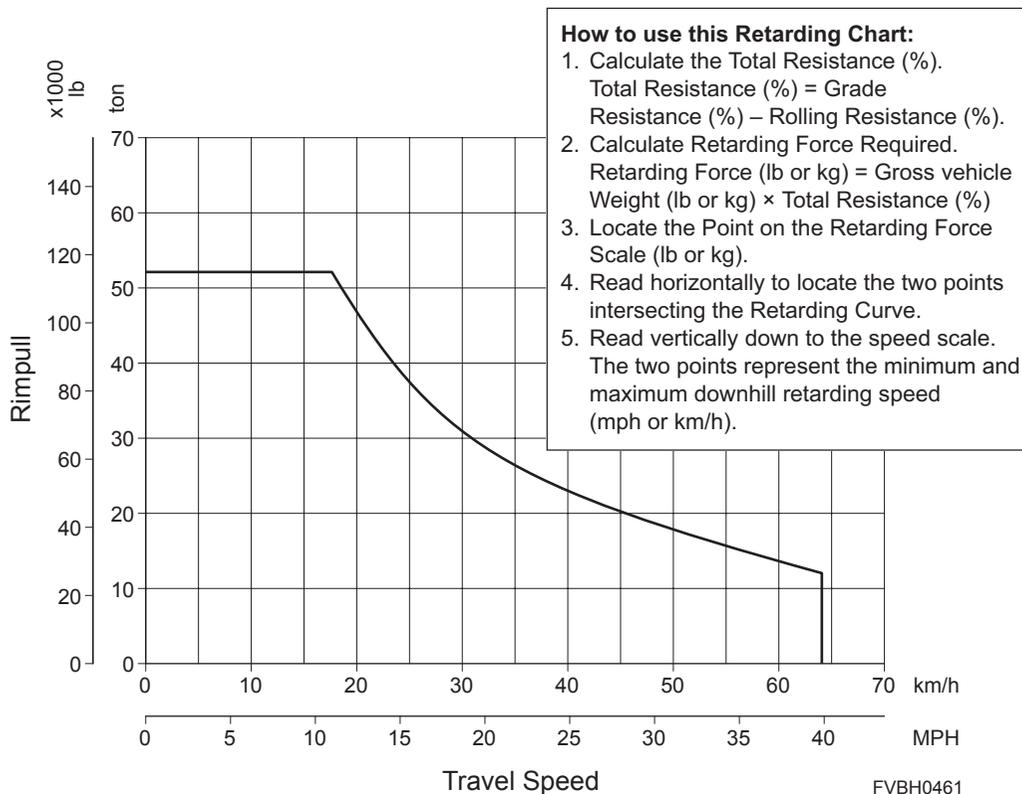

How to use this Retarding Chart:

1. Calculate the Total Resistance (%).
Total Resistance (%) = Grade Resistance (%) – Rolling Resistance (%).
2. Calculate Retarding Force Required.
Retarding Force (lb or kg) = Gross vehicle Weight (lb or kg) × Total Resistance (%)
3. Locate the Point on the Retarding Force Scale (lb or kg).
4. Read horizontally to locate the two points intersecting the Retarding Curve.
5. Read vertically down to the speed scale.
The two points represent the minimum and maximum downhill retarding speed (mph or km/h).

Description	Features
<p>PMC (power train management control)</p>	<ul style="list-style-type: none"> • Vehicle condition can be easily monitored to confirm functions or perform troubleshooting efficiently. • Stored data can be downloaded through customer provided personal computer with Komatsu PMC download software to transfer the data to customer maintenance/production database. • Memory card type Payload meter (PLM2) data can also be downloaded through the same PC connection port. (HD785)
<p>Auto Retard Speed Control (ARSC)</p> 	<ul style="list-style-type: none"> • Setting of desired downhill speed is possible • Fine adjustment of setting speed is possible within ± 5 km/h (3.1 MPH)
<p>Payload meter</p> 	<ul style="list-style-type: none"> • The payload meter measures and records the amount loaded, and also uses the external display lamps to show the present payload and to estimate the weight when the next bucket is loaded, thereby informing the loader operator. So it is possible to load the most suitable amount and to avoid overloading. • By knowing the production, it becomes possible to carry out efficiency control of combinations, and administration of economic use of the machines.
<p>Automatic three-mode suspension</p> 	<ul style="list-style-type: none"> • The suspension is controlled to give the optimum suspension characteristics for the travel conditions, so the riding comfort and travel stability are greatly improved. • The travel stability functions, such as anti-roll and anti-dive, prevent excessive stress from being brought to bear on the frame, thereby contributing to increased service life. • (The electronic display system must be installed.)
<p>Exhaust retarder</p> 	<ul style="list-style-type: none"> • Combination with the oil-cooled multiple disc retarder makes high-speed downhill travel possible, thereby improving working efficiency. • It is possible to increase the wear life of the service brake.
<p>Front brake cut off system</p>	<p>The operation of the front brake can be cancelled with a switch. This is effective in preventing slipping on job sites where the road surface is poor.</p>

Description	Features
<p>Three-way emergency brake</p> 	<p>For safety, independent circuits are used for the brakes on the front and rear wheels, but if for any reason the service brake should lose power, the double-caliper parking brake is in another circuit, so it can always be used as an emergency brake to increase the safety (A two-way emergency brake is standard on the HD785-5, and a double caliper parking brake is installed.)</p>
<p>Differential lock</p> 	<p>This device controls the operation of the rear axle differential and is effective in preventing slipping and improving drawbar pull on soft ground.</p>
<p>Body liner</p> 	<p>A liner plate for the purpose of preventing wear or deformation of the body. There are two types of liner: the steel liner and the rubber liner. Their use must be distinguished according to the purpose. (See "Body selection")</p>
<p>Body extension</p> 	<p>This extends the height of the side of the dump body. This increases the capacity of the body to ensure the rated load (For example: the capacity of the HD325-5 is 32 tons) when handling loads with a low specific gravity. It is also used to prevent spillage of load caused by adverse travel conditions (rough road surface, uphill slope, downhill slope, road with curves).</p>
<p>Platform guard (See 4A-41)</p>	<p>This guard protects the right platform from rocks falling from the dump body.</p>
<p>Transmission under guard (See 4A-41)</p>	<p>This guard protects the transmission oil pan from flying stones when traveling.</p>
<p>Propeller shaft guard (See 4A-41)</p>	<p>This guard prevents secondary damage if the propeller shaft is broken.</p>
<p>Tire guard on body (See 4A-41)</p>	<p>When large diameter tires are installed, this guard protects the tires from rocks falling from the dump body. (This is necessary when large diameter tires are installed.)</p>
<p>ROPS (See 4A-41)</p>	<p>ROPS meeting SAE J1040C</p>
<p>Noise suppression kit</p> 	<p>This consists of both side covers of the engine compartment, undercover, sound absorbing blade, sound absorbing material on under-surface of hood and sound suppressing muffler. (The muffler must be installed)</p>

Description	Features
<p>Muffler (without body heating)</p> 	<p>This can reduce the exhaust noise regardless of body raising. This muffler is available for users who do not require body heating.</p>
<p>Radiator shutter</p>	<p>The radiator shutter is installed to make the rise in water temperature faster when starting in cold areas, and to prevent overcooling. It detects the water temperature and automatically opens or closes the shutter, so there is no time taken for installation or removal as with a radiator curtain.</p>
<p>Water separator</p> 	<p>This removes water in the fuel, thereby maintaining engine reliability and durability. (Areas or environments where fuel management is insufficient.)</p>
<p>Fast-fill fuel system</p> 	<p>A quick charge coupler to match the WIGGINS quick charge system is installed to the fuel tank. (The user must provide the pump unit.)</p>
<p>Air dryer</p> 	<p>A fin-cooled type dryer is installed in the air circuit to remove the water in the circuit. This prevents problems caused by freezing of water in the air circuit and makes maintenance easier.</p>
<p>Air tank auto-drain valve</p>	<p>This automatically drains the water in the air tank, making maintenance easier. (To prevent water from freezing inside the tubes.)</p>
<p>Anti-lock Braking System (ABS)</p>	<p>This system prevents the tire lock under slippery condition while applying service brake and gives safety drive of the truck.</p>
<p>Automatic Spin Regulator (ASR)</p>	<p>Since ASR automatically prevents the rear wheels from slipping singly on soft ground, etc., proper drive force is obtained.</p>

TIRE SELECTION

Tire availability

Komatsu Dump Trucks employ the tubeless tire only.

Every tire size is classified into E3 or E4 codes.

Either E3 or E4 code had CR, GP or HR characteristics to meet specific operating conditions.

The relation between the tire characteristics and operating conditions is shown in the table.

NOTE: *When installing radial tires, please use the special rim for radial tire.

Tire characteristics and operating conditions

Characteristics	Haul Distance and Payload	Surface Condition							
		Rocks Scattered on Surface			Surface Ruggedness			Sub-base	
		Thin	Normal	Thick	Good	Normal	Bad	Normal	Soft
CR	Low TKPH (TMPH)		○	○		○	○	○	○
GP	Middle TKPH (TMPH)		○			○		○	
HR, SHRR	High TKPH (TMPH)	○			○			○	

TMPH RATING

Where the ambient temperature in an operating environment is high or where a long haul or high-speed drive is required, the standard tires are sometimes unsuitable because of their small TMPH.

Under the above operating conditions, it is recommended that the optimum tires be determined after obtaining TMPH by applying the formulas stated in the section 15 and referring to the following table.

NOTE: The TMPH rating is based on U.S. ton (not on metric ton)

$$\Delta \text{TMPH} = \Delta \text{TKPH} \div 1.46$$

NOTE1: (1) The TKPH in the table is the value at 38°C (100°F) an ambient temperature. (The value as of February, 2000.) When the distance for the round trip exceeds 5 km, the tire life is governed by the travel conditions, so check with the tire maker for details of the TKPH when selecting the tires.

(2) The value for TKPH is reviewed from time to time by the tire maker, so consult the maker for the latest values.

(3) For details of the TKPH value and tire specifications for conditions not given in this table, please consult the tire maker.

NOTE2: Some tires in the above table cannot be selected for some destinations.

- NOTE1:** (1) The TKPH in the table is the value at 38°C (100°F) an ambient temperature. (The value as of February, 2000.)
When the distance for the round trip exceeds 5 km, the tire life is governed by the travel conditions, so check with the tire maker for details of the TKPH when selecting the tires.
(2) The value for TKPH is reviewed from time to time by the tire maker, so consult the maker for the latest values.
(3) For details of the TKPH value and tire specifications for conditions not given in this table, please consult the tire maker.

NOTE2: Some tires in the above table cannot be selected for some destinations.

1. Body selection

When it comes to selecting the body, it is necessary to consider the specific work application, size of rocks, specific gravity of material and loading machines etc.

Select the optimum body according to the chart shown below.

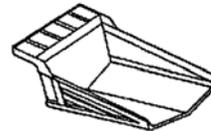

If similar dump trucks are working at a specific job sites, please refer to the body types used when making selection.

2. Features of each body

1) Liner-less body

- Liner-less body is suitable for job sites where loading of sandy or rough soil.
- Liner is not installed.

2) Rock body

- Rock body is suitable for job sites requiring the handling of rocks such as macadam, in limestone mines and for civil engineering etc.
- Total face of inner body is lined with steel liners.

			Liner-less body	Rock body	
Body selection point	Durability of body		○	⊙	
	Operator comfort at loading	Shock	○	○	
		Noise	○	○	
Price comparison (1 : most expensive)			3	2	
Propriety by loading machines	Wheel loader	Standard for size of rocks	Below 0.5 m or 0.16 ton	●	○
			Below 1.0 m or 1.3 ton	X	●
			Below 1.5 m or 4.4 ton	X	X
	Hydraulic excavator		Below 0.5 m or 0.16 ton	●	○
			Below 1.0 m or 1.3 ton	▲	●
		Below 1.5 m or 4.4 ton	X	▲	

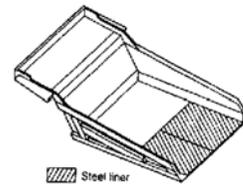

Remarks ○ : Ordinary ⊙ : Excellent
 ● : Best X : Prohibited
 ▲ : Possible when loading height is lower than body top end.

3) Dump body for quarry (standard)

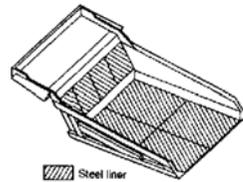

- A special large capacity dump body featuring increased strength for quarrying work.
- Newly developed super hard wear-resistant steel plate is 25% harder than conventional materials.
- Uses job sites where mainly limestone and gravel are handled, and where liners have not been installed.
- Job sites where soil contained rock is handled and little impact is made when it is loaded, and where the liner replacement interval is at least 12000 hours.
- Hauling of limestone
- Hauling of soil and sand
- Hauling of soil containing rock

**4) Special dump body with half liner for quarry (option 1)**

- Uses job sites which are basically similar to 4) above, but where the cycle time is short and unloading frequency is high.
- Job sites where liners are used and replaced at intervals of 8000 ~ 12000 hours.
- Hauling of soil and sand
- Hauling of soil containing rock
- Hauling of medium and small size rock (1 m maximum).

**5) Special dump body with full liner (except sides) for quarry use (option 2)**

- Use job site where rock is mainly handled, and a liner is used and replaced at intervals shorter than 8000 hours.
- Hauling of medium and small size rock (1 m maximum).
- Hauling of hard rock

Cycle time = Loading time + Hauling time + Dumping time + Return time + Spot & delay time

- Determine hauling and return time from the above table respectively.
- Loading time = (Loader cycle time) × (No. of cycles to fill dump truck)
- Average fixed time (dumping, spot & delay): 1.25 ~ 1.65 min.

Estimated Production (Metric ton per hour)

Ecology Features

ecot3 (EPA Tier 3, EU Stage 3A certified engine)

Komatsu develops and produces all major components, such as engines, electronics and hydraulic components in house.

With this “Komatsu Technology”, and adding customer feedback, Komatsu is achieving great advancements in technology.

To achieve high levels of productivity and ecology, Komatsu developed the main components with an advanced control system.

The result is a new generation of high performance and environment friendly machines.

(HM250-2, HM300-2, HM350-2 and HM400-2)

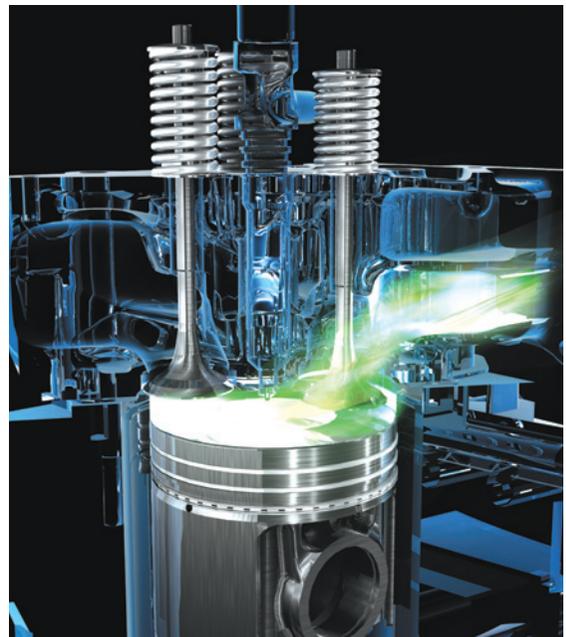

Fuel efficient electronic controlled engine

The engine is EPA Tier 3 and EU Stage 3A emission regulation certified. The engine is turbocharged and features Common Rail Injection System (CRI) and air-to-air aftercooling to maximize power, fuel efficiency and emission compliance.

To minimize noise and vibration, the engine is mounted to the main frame with rubber cushions.

(HM250-2, HM300-2, HM350-2 and HM400-2)

■ **Comfortable operator environment**

● **Wide, Spacious Cab**

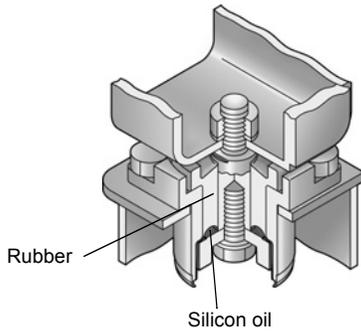

The wide cab provides a comfortable space for the operator and a full size buddy seat. Large, electrically operated windows and the operator's seat positioned to the left side ensure superior visibility.

● **Ergonomically Designed Cab**

The ergonomically designed operator's compartment makes it very easy and comfortable for the operator to use all the controls.

● **Viscous Cab Mounts**

Viscous mounts reduce the noise transmitted to the cab and achieve a quiet noise level.

■ **Easy maintenance**

● **Tiltable cab**

The cab can be tilted rearward to provide easy maintenance/service for the engine and transmission.

● **Extended Service Intervals**

In order to minimize operating costs service intervals have been extended.

- Engine oil: 500 hours
- Transmission oil: 1000 hours
- Engine & transmission filters: 500 hours

● **Hydropneumatic Suspension for All Terrain**

The hydropneumatic suspension assures a comfortable ride even over rough terrain and ensures maximum productivity and operator confidence.

● **Air Suspension Seat**

The air suspension fabric covered seat which is adjustable to the operator's weight is provided as standard.

● **Electric Body Dump Control Lever**

The extra light lever makes dumping easier than ever.

● **Supplementary Steering and Secondary Brakes**

Supplementary steering and secondary brakes are standard features.

● **Easy-to-See Instrument Panel**

The instrument panel makes it easy to monitor critical machine functions. In addition a caution light warns the operator of any problems that may occur. Problems are recorded in the monitor and indicated as service codes.

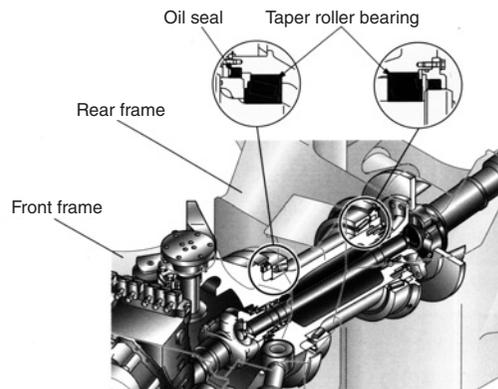

This makes the machine very friendly and easy to service.

● **Steering Wheel and Pedals**

Low effort pedals reduce driver fatigue when working continuously for long periods. The tiltable, telescoping steering column enables operators to maintain the optimum driving position at all times.

● **Fewer Grease Points**

We have minimized the number of grease points by using maintenance-free rubber bushings and a lubrication-free oscillating hitch.

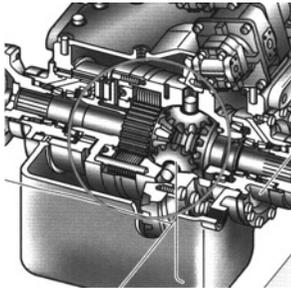

■ **High productivity**

• **High performance SAA6D125E-3 and SAA6D140E-3 Komatsu engines**

- Those engine delivers faster acceleration and higher travel speeds with the highest horsepower per ton in its class.
- The engines meets the USA EPA Tier 2 emission regulations.
- High torque at low speed, impressive acceleration and low fuel consumption ensure maximum productivity. (HM300-1, HM350-1 and HM400-1)

• **Interaxle & Differential Locking Systems**

The full-time six-wheel drive system reduces slippage. A wet multiple-disc interaxle clutch also locks the three axles in unison for greater traction. The interaxle lock and differential locks can be switched on and off while the truck is traveling, thereby boosting productivity.

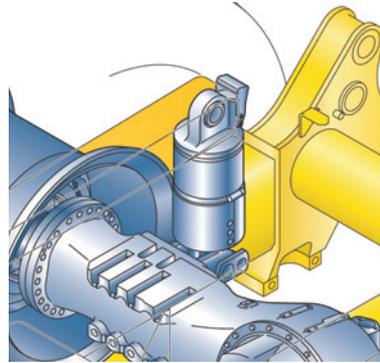

• **Komatsu Designed Electronically Controlled Transmission**

Komatsu designed Electronically Controlled transmission called K-ATOMiCS has been successfully employed in Komatsu's rigid dump trucks. The electronic clutch modulation system ensures proper clutch pressure when the clutch is engaged. the total control system controls both the engine and transmission by monitoring the vehicle conditions. This high technology system assures smooth shifts without shock.

• **Hydropneumatic Suspension**

The hydropneumatic suspension has been proven on Komatsu's rigid dump trucks. The front axle suspension employs "De Dion" type design, allowing the machine to ride more smoothly over bumps. The rear-axles are mounted on a dynamic equalizer structure equipped with hydropneumatic suspension.

• **Large Capacity Body and Box Section Frame Structure**

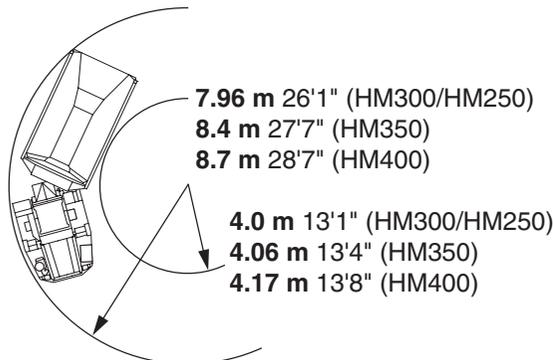

The body is built of thick wear-resistant steel with a Brinell hardness of 400, and the body shape provides excellent load stability.

• **Articulated Steering**

Fully hydraulic articulated steering offers low-effort operating performance and maneuverability. Small minimum turning radius provides the freedom to move about in confined areas.

• **Fully Hydraulically Controlled Wet Multiple-Disk Brakes and Retarder**

Wet multiple-disk brakes have been proven on Komatsu dump trucks and wheel loaders. They ensure highly reliable and stable brake performance. The large-capacity wet-multiple disk brakes also function as a highly responsive retarder which gives the operator great confidence while traveling downhill.

Use of travel performance curve

For assessing a vehicle's grade-ability, travel speed, rim pull, etc. First, draw a vertical line according to the vehicle's weight (A) and mark the point (B) corresponding to total resistance (the sum of rolling resistance and grade resistance). Next, draw a horizontal line from (B), then mark (C) where the line intersects the rim pull curve and read (E) for the rim pull. For travel speed (D), draw a vertical line downward from (C).

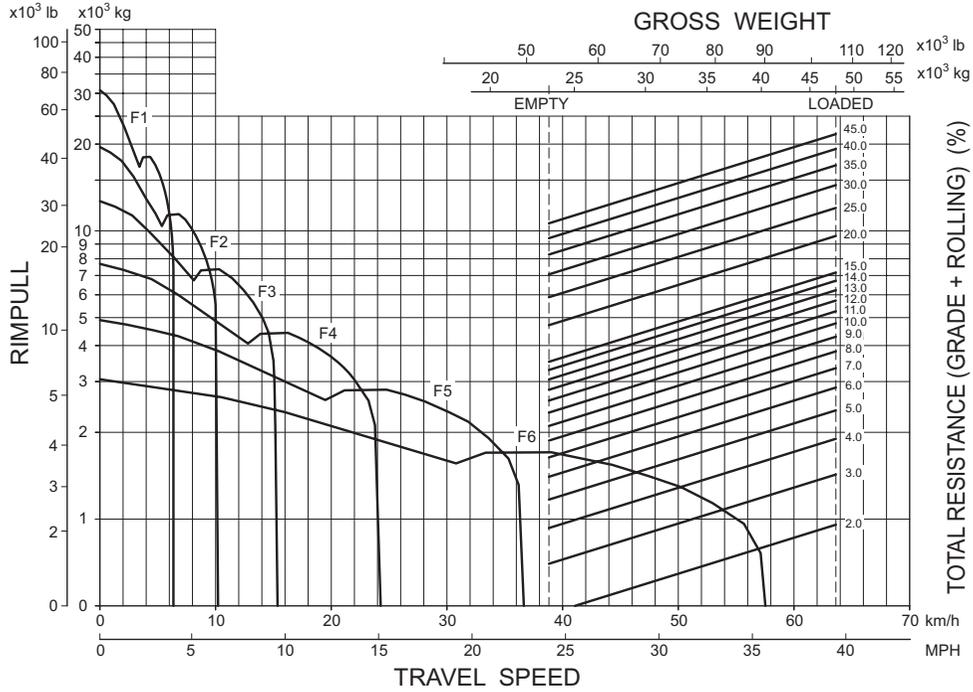

For instance, when traveling an 8% gradient and encountering a 5% rolling resistance, a vehicle with a 36.5 ton (40-U.S. ton) payload should have a rim pull of 8.5 tons (18,740 lb) and travel at a speed of 10 km/h (6.2 MPH) in forward 2nd gear.

Dimensions 4C-4

High efficiency hauling operation on uneven and soft grounds

A full 360° rotation capacity provides forward-facing operation under any conditions and minimizes space required for turn-around.

- Super low ground pressure;
 - Does not bog down in wet and swampy area.
 - Keep working on rainy day.
- Super gradeability
 - Faster climbing speed on steep slope.
 - Reduced slippage in wet conditions.
 - Eliminates need for road maintenance machine.
- Extra space for turn-around not required
 - Able to work in confined area
 - Always keep forward-facing operation.
 - Minimize ground disturbance.
 - Longer rubber shoe life
- Easy to side dump
 - Easy to dump materials along road.
e.g. Pipe laying, Smooth spreading
- Easy positioning for loading
 - Easy to load material from any direction.

High performance

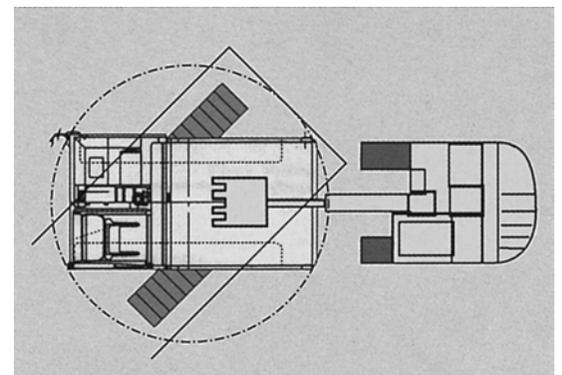

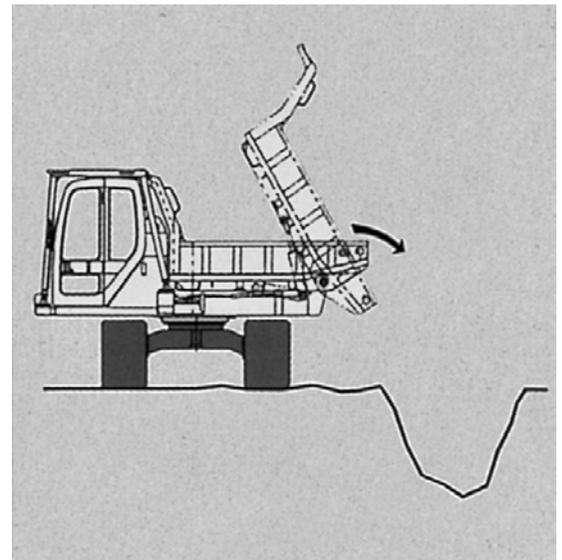

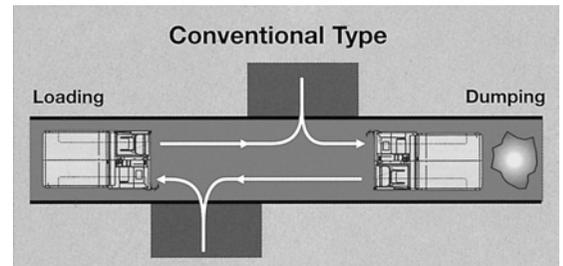

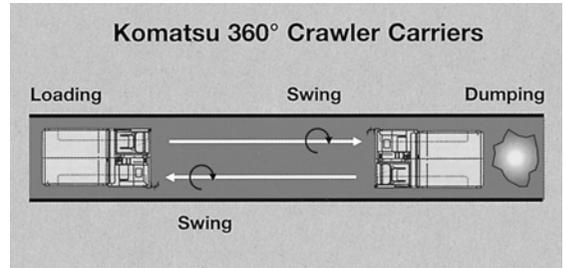

- High travel performance
Travel performance on soft ground and slopes is greatly improved by large drawbar pull, and low ground pressure.
- Automatic high-low downshift function
If the travel load increases when the machine is traveling in the high-speed range, the transmission gear automatically downshifts to the low speed range to increase the drive force.

Operator comfort

- Large cab
A large cab provides secure, safe and comfortable operation. The CD60/110R offer all the conveniences an operator could want. Full adjustable seat and well placed low effort controls make work easy on any job site.
- Easy dumping by foot pedal operation
Travel direction and upper structure rotation is controlled by hand levers. Dumping is controlled by a foot pedal allowing effective, well-balanced use of both hands and feet.

Excellent safety, reliability and durability

- ROPS/FOPS
The CD60/110R are equipped with ROPS and FOPS for safety.
- Field-proven hydraulic components
Rotation and control functions offer excellent performance with unmatched reliability.
- Strong and deformation-resistant dump body
The dump body is made of high tensile strength steel and reinforced with ribs to prevent deformation.

Wide product range

Komatsu offers you a complete choice in every category :

- Machine size and weight.
- Engine power
- Rigid or articulated frame
- Transmission : Direct drive or HYDROSHIFT
- Blade length

High productivity

- Komatsu's diesel engine delivers a strong horsepower and has a direct-injection system for fuel savings and cleaner exhaust.
- The HYDROSHIFT transmission ensures not only efficient power transmitting ability for reduced fuel costs, but also a single-lever speed control and F/R directional changes for easy operation.

Hydraulic circuits with pilot checks valves

Pilot check valves are built into the blade lift, front axle lean and frame articulation circuits.

This prevents drifting of these cylinders, and results in high finishing accuracy. These valves also help maintain the original equipment position and to prevent drift if the control lever is operated with the engine stopped.

Wide working range

Wide blade range, hydraulic blade side-shift, infinitely varied bank cut angle make machine ready for a real variety of operations.

The blade bank-cutting position can be controlled up to 90° on either side from the operator's seat.

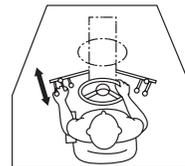

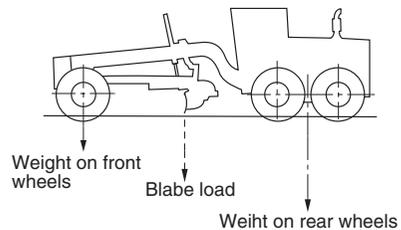

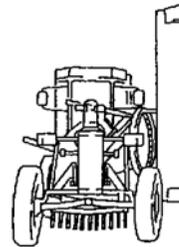

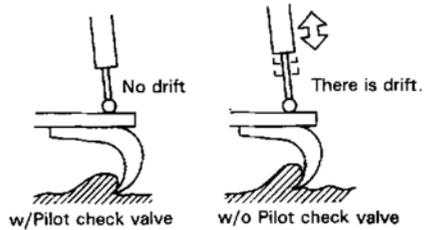

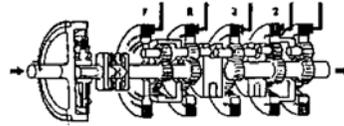

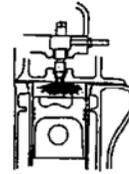

Ideal weight distribution

- Since the front wheels are loaded with the optimum weight distribution to prevent side slipping, outstanding operational stability is assured especially during operations that impose heavy side thrust on the machine.

Easy operation / operator comfort

Ergonomically arranged instrument and control levers

Short-stroke levers and reduced-effort controls assure responsive, finger-touch control. Ergonomic, human-engineered design includes logical arrangement of instruments and levers based on frequency of manipulation.

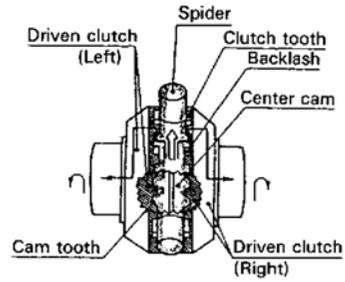

FVBH0015

■ **Max. uptime**

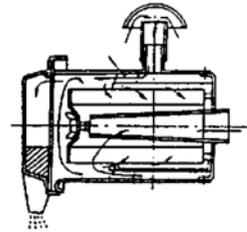

● **Non-spin differential**

Non-spin differential with automatic locking and unlocking can be installed as an option on the final drives, assuring the optimum in smooth steering.

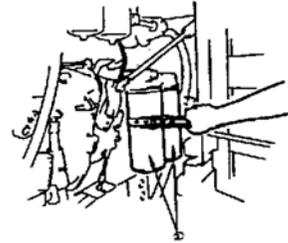

● **Air cleaner with automatic dust evacuator**

Dry-type air cleaner with automatic dust evacuator for longer element service.

● **Spin-on type filters.**

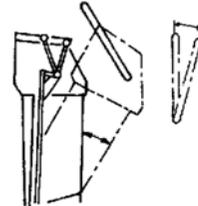

Spin-on type engine oil filters and fuel filters for easy element replacement.

■ **Additional features for GD825A**

● **Tiltable steering post**

Since the left and right control lever wings and steering post are each separate and independently adjustable, the operator can adjust them to the optimum angle for convenience. During travel, the steering column may be tilted toward the operator for easy steering control.

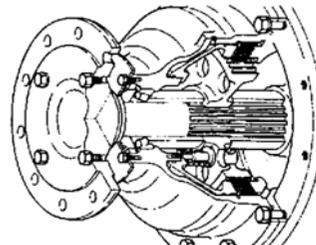

● **Fully adjustable operator seat**

Fully adjustable suspension seat offers more comfortable ride.

● **Oil cooled multiple-disc brake**

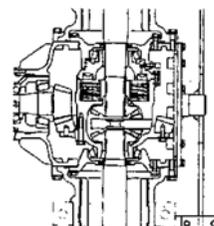

Powerful, adjustment free, oil-cooled multiple disc brakes are employed on all rear tandem wheels.

Since brake discs are oil-lubricated in the tandem cases, high cooling efficiency is maintained to prevent heat build - up during frequent, heavy-duty braking action.

● **Lock / unlock differential gear**

The differential is equipped with an electric-over-hydraulic multiple-disc clutch can actuate differential lock or unlock simply by turning the switch on the console.

* : USA version

Description	Features
<p>ROPS (Roll Over Protective Structure) cab</p> 	<p>The combination of ROPS and a steel cab ensures safety in places where there is danger of the machine turning over and to protect the operator from wind, rain, cold, sand and sun. Low profile and full height cabs are available. Full height ROPS cab is 90 mm (3.5") higher than the low profile cab.</p>
<p>Deluxe steel cab (Type A)</p> 	<p>Consisting of a steel framework with glass doors, windshield and windows, it is completely enclosed and lined with noise - absorbing materials. (This cab is available for GD825A only.)</p>
<p>Standard steel cab (Type B)</p> 	<p>It consists of a steel framework with glass doors, windshield and windows. (This cab is available for all models excluding GD825A).</p>
<p>Simple steel cab (Type C)</p> 	<p>It consists of a steel framework with glass doors, windshield and windows. Upper front glass is fixed to cab frame. (This cab is available for all models excluding GD825A).</p>
<p>ROPS canopy</p> 	<p>This ensures safety in places where there is danger of the machine turning over and to protect the operator from the sun.</p>
<p>Canvas canopy, Steel canopy</p> 	<p>The simple steel frame is topped with a canvas canopy. This protects the operator from the sun.</p>

Description	Features
<p>Front blade</p> 	<p>It is an indispensable work tool for volume push - carry operations and for facilitating difficult spreading jobs involving large heaps of slabby or rocky materials unloaded from dump trucks.</p>
<p>Front pull hook</p> 	<p>Hook mounted front of the machine for towing. There are two kind of front hooks.</p> <ul style="list-style-type: none"> • Front weight with nails. • U - shape bracket welded on front axle. <p>If front attachments (for example front blade etc), are equipped, this hook is not available.</p>
<p>Push plate</p> 	<p>This is used for pushing trees down or pushing machine up in muddy terrain. This is used also as a counterweight to prevent the front wheels from coming off the ground during ripping operations.</p>
<p>Scarifier</p> 	<p>This attachment digs up hard ground, like asphalt, old pavement and frozen surfaces cannot be removed by the blade. The number of teeth used depends upon the ground hardness. High-strength alloy steel tips can be mounted on the teeth to prevent tooth wear and extend their service for economical performance.</p>
<p>Extension blade</p> 	<p>By extending the blade length on one side or on both sides, a larger operating width is obtained, so the work can be carried out with high efficiency. This can only be used for light duty operations such as leveling soil. It is not possible to carry out bank cutting with extension blade at the bottom.</p>
<p>Hydraulic blade tip control</p>  <p>Tilt cylinder Cutting angle is adjustable.</p>	<p>Adjusts the blade - cutting angle according to ground and travel - speed conditions. The angle is freely controlled with a lever operable from the operator's seat.</p>
<p>Blade accumulator</p> 	<p>To relieve the shock caused by load when using the blade. The load on the blade is kept constant without any need to operate the blade lift lever, so blade operations are easy.</p>

Description	Features
<p>Blade float</p> 	<p>By setting the hydraulic pressure inside the blade lift cylinder to 0, so that only the weight of the blade is applied to the digging surface, operations such as removing grass become easier.</p>
<p>Rear mounted ripper</p> 	<p>This attachment can be used to dig out rocks or hard ground not removable by scarifier. A push plate must be mounted at the same time, and the small front weight must be removed.</p>
<p>Lock / unlock differential gear</p> 	<p>The differential built in the final drive case provides the following precise operations. Excellent leveling even when the machine is turning a corner. Reduced turning radius. Reduced tire wear. By locking the differential, sufficient traction is obtained even in muddy terrain. Lock or unlock are selectable by turning a switch.</p>
<p>Non - spin differential</p> 	<p>Depending on the ground condition, the locking and unlocking are automatically switched. The advantages are the same as for the lock / unlock differential given above.</p>
<p>Wet type disc brake</p> 	<p>The brakes are sealed type, so no water or mud can get in. This ensures stable braking at all times. Oil lubrication means wear is kept to the minimum, so the brakes are maintenance free. The brakes are operated pneumatically, so a small operating effort of brake pedal gives secure braking. There are two brake circuits, so even if one of the air circuits should be damaged, it is still possible to brake the machine.</p>
<p>Air dryer</p> 	<p>The function of the air dryer is to remove the water vapor from the compressed air in the circuit. In this way it protects the components of the equipment and prevents problems in operation in cold areas.</p>
<p>Inspection lamp</p>	<p>This is used for inspection and maintenance at night.</p>
<p>Yellow warning lamp</p>	<p>Signifies that the machine is in operation.</p>
<p>License - plate lamp</p>	<p>Lamp for lighting license plate</p>

SECTION **5B**

VIBRATORY ROLLERS

CONTENTS

Features 5B-2
Specifications 5B-3
Dimensions 5B-4

- **Large Compaction Force:**

The larger centrifugal force allows for a thicker layer compaction, which in turn allows a fewer number of shuttle runs over the surface for reduced operating cost.

- **Articulated Frame for High Mobility:**

The frame articulation provides a small turning radius, making the machine highly mobile even in restricted areas.

- **Easy Compaction on Road Shoulders:**

The frame overhang on both sides allows compaction very close to curbstones or fences.

- **One-Lever Hydrostatic Transmission System:**

The hydrostatic transmission allows directional changes, starts, braking and stop to be achieved with only one lever. Also, it allows travel speed to be controlled to optimum levels to suit operation.

- **Comfortable to Operate:**

A rubber-mounted operator's compartment is designed to reduce vibration for improved operator comfort. The operator seat, sliding fore and aft, provides the optimum driving position for any size operator.

Additionally, full-hydraulic power steering provides light control effort.

- **Economical, Durable Engine:**

The engine, featuring direct injection and troidal combustion chambers, offers proven durability and low fuel consumption. The hydrostatic transmission assures excellent flat torque for very smooth operation.

- **Small Overhang:**

Small overhang of the left side of the machine facilitates quick and smooth compaction work very close to walls, fences, or posts.

- **Large Roll Width and Working Speed:**

Large roller width and working speed allows shorter cycle time for speedy job completion.

- **Low Noise and Vibration:**

Rubber pads for vibrator shaft support, steering wheel support, and operator's compartment suppress vibration before it reached the operator.

- **Sprinkler System:**

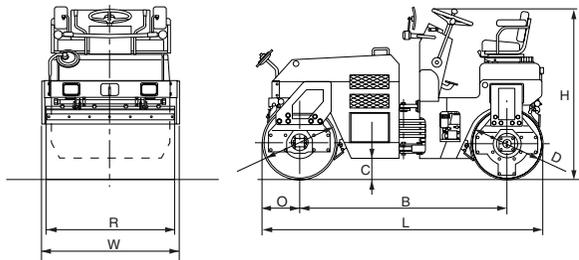

A sprinkler system is essential for asphalt compaction work. Water is spread uniformly over the whole span of the rollers and a large-capacity water tank allows extended operation before refilling.

SECTION **5C**

TIRE ROLLERS

CONTENTS

Features 5C-2
Specifications 5C-3

- **High efficiency, high precision rolling operations**

The wide rolling width provides a large hourly production, thereby reducing the project period.

By using wide tires which provide a uniform ground pressure, it is possible to achieve high precision rolling with a high degree of flatness. The amount of overlap is large and uniform, so there are no parts left unrolled, and the rolling operation can be carried out efficiently.

- **Side rolling is also easy**

The front tires are over-banked a large amount from the frame, so it is possible to carry out rolling operations right up to the edge of walls or roads.

- **Optimum water spray, oil spray device installed for operation on paved surfaces**

A job-proven diaphragm type pump is used to spray water. This can give a uniform spray regardless of the slope of the surface being rolled. The capacity of the water tank is a large 220 liters, which enables water spray operations to be carried out for a long period with one tank of water.

- **Stable, low center of gravity design**

The design with a low center of gravity allows a large angle of lean to the left or right, thereby ensuring stable operations even on rough ground.

- **Easy operation and control**

A HST (hydrostatic transmission) is used. Change of direction, braking, and speed control operations can be carried out simply with one FR lever.

The knob on the steering wheel and the power steering system enable steering operations to be carried out with a light touch.

- **High safety brake system**

For normal operations, the FR lever is placed at neutral and the HST brake is used to brake the machine.

The parking brake is a mechanical type.

In emergencies, the foot brake is operated to use the braking force of both the HST brake and the mechanical brake.

- **Comfortable, pleasant operation**

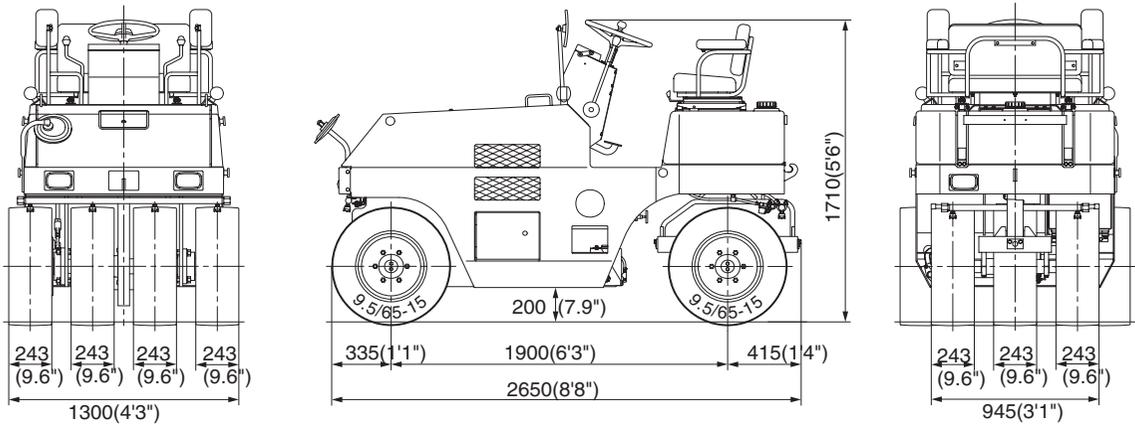

A wide bench seat is used to enable the operator to take the most suitable driving position, so he feels no fatigue even after long hours of operation.

- **Easy maintenance**

The structure of the fully hydraulic system has made the drive system easier, so daily maintenance can be carried out easily.

BACKHOE LOADERS

CONTENTS

Features 6-2
Specifications 6-3
Dimensions 6-5

■ Built with proven HydrauMind excavator technology

- Komatsu's exclusive HydrauMind™ hydraulic system is the ultimate combination of power and precision creating one of the most productive backhoe loaders in the world.
 - Closed center Load Sensing System (CLSS)
 - Load Independent Flow Divider (LIFD) hydraulic valve block
 - 2 working modes for backhoe operations
 - Speed-Up function for loader operations

■ Superior lift capacities and breakout forces

- Komatsu's superior lift capacities and breakout forces are achieved exclusively through the HydrauMind hydraulic system.
- The front loader has superb breakout forces and lift capacity due in part to the unique design of the loader.

■ Komatsu's ergonomic innovations create the perfect operating environment.

- We ergonomically designed the controls offering ease of operation, using a hydraulic system that responds smoothly and precisely.
- The cab allows for all-around visibility and is extremely quiet.
- The ergonomically designed suspension seat is very comfortable and fully adjustable.

■ Multi-function loader control lever's cutting edge design allows for fingertip operation of all key loader functions.

- Transmission disconnect
- Auxiliary hydraulic control
- Rear differential lock
- Hydraulic speed up function
- Kick down (PS version only)

■ Low lever efforts allow for PPC-like feel during backhoe operation.

■ All-around visibility, compactness and maximum accessibility for maintenance.

■ Powered by a new generation of Komatsu engines.

The large cubic displacement of engines, ensures high torque and power, and above all, exceptional reliability.

■ Komatsu Backhoe Loaders use service brakes with multiple wet discs and independent circuits operated by two separate pedals.

■ A high steering angle combined with excellent maneuverability result in fast cycle times for the operator.

■ Komatsu's backhoe loaders are equipped with Power Shuttle transmissions and "Power shift" inverters.

■ Komatsu's Electronic Gear Management (EGM) system allows the operator to utilize the Powershift transmission in either manual or automatic mode.

The Komatsu Powershift transmission has been designed to safely allow the operator to perform all functions efficiently. In addition to offering two modes of operation, the Powershift comes standard with:

- Self diagnostics system
- Anti-theft system
- Engagement and automatic disengagement of four wheel drive
- Kick down switch

SECTION **7A**

SKID STEER LOADERS

CONTENTS

Features 7A-2
Specifications 7A-3
Dimensions 7A-4

- **Hydraulic servo controls**
Easier to use, they require very little effort, while ensuring extremely precise maneuvers.
- **Komatsu CLSS**
The hydraulic system, which automatically combines force and speed, ensures perfect control overall movements.
Double-adjustment travel pumps, with automatic power control device (A. P. C.) and axial piston engines with double travel speed, provide above-standard performance, ensuring exceptional versatility and rapidity.
- **Comfort**
The ease of operation, just two steps to reach the seat, the ergonomic access and the ample space inside the cab assure maximum operating comfort and maximum visibility.
- **Safety**
The wheelbase and axle distance ensure reduced tire wear and balanced weight distribution, for safe operation on any ground. The low profile of the engine hood guarantees excellent visibility on rear part of the machine.
- **Versatility**
The foot accelerator ensures greater control over power during operation.
Ready for use with any equipment, the base version features an auxiliary hydraulic circuit with proportional control.
- **Super Flow version**
The Super Flow system increases the flow of oil available to the equipment, and features a draining system and electrical connections. The joysticks and proportional pedal make it possible to control all the system functions. A second hydraulic circuit is available for equipment that requires simultaneous movements.
- **Easy and quick maintenance**
The simple opening of the engine hood makes refilling and periodical checks easy. In addition, the tilting radiators can be easily reached by simply opening the rear door.
One lock only for the hood and the door, which together enclose and protect all service and refill points.
 - Pins with extended greasing intervals (250 hours)
 - Battery with charge gauge
 - Air filter with safety cartridge
 - Removable polyvinyl tank
 - See-through gas oil filter
 - Environmental-friendly draining systems
- **Tilting cab**
The combined tilting of the cab, engine hood and footboard (patented system) offers complete access to all the components and allows extraordinary maintenance operations to be performed from several positions.

CONTENTS

Features 7B-2
Specifications 7B-3
Dimensions 7B-4

- **Hydraulic Servo-Controls**

The PPC servo-controls make the machines extremely user friendly: natural movements and unique efficiency come with minimum effort. The right joystick controls the arm and the bucket, while the left one controls the transmission.

- **Versatility**

Thanks to the wide supporting surface the tracks offer, the CKs can efficiently work on any type of soil, including mud and snow, thus minimizing downtime related to bad weather. Furthermore, as the ground pressure is much lower than the one characterizing the wheeled versions, these machines can work at their best even on yielding soil, such as sand.

- **The Tracks**

The tracks ensure exceptional stability and traction force on all types of soil. The wide base gives excellent stability to the machine and strongly reduces vibrations and increases operator comfort. The hard steel ensures high resistance to all parts which are most subject to wear, such as gears, rollers and idlers. At the same time, a bigger section and multiple rubber covered steel reinforcements ensure extended duration to the shoes.

- **Two Speeds**

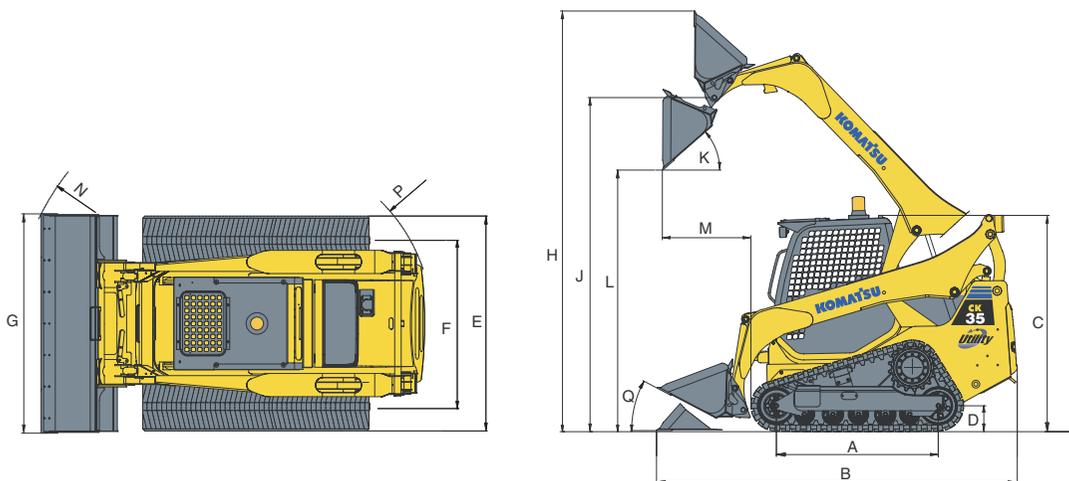

The second speed, which is standard, pushes the up to a 12 km/h top speed and drastically reduces the transfer times within the yard, thus increasing the productivity. The first speed is used while digging or climbing, whenever maximum drawbar pull is required.

Productivity 8A-8

Benefits Of Mobile Crusher & Recycler

1. Demolished wasted material (concrete, asphalt, brick, etc.) can be re-used effectively.
2. As the wasted material can be utilized again, the cost for purchasing new material can be saved.
3. The cost for hauling and dumping (of the wasted material) with trucks can be minimized.
4. Even when the processed material should be used outside, the transportation cost can be much saved. (because of the compactness of the material)
5. The elimination of the trucking also offers less generation of the exhaust gas.
6. The machine can be used whenever and wherever you like because of its mobility.

**■ Jaw crusher, with superior crushing force and reliability, is installed.
(BR100JG, BR380JG, BR580JG)**

- Natural rock, concrete, asphalt concrete, etc., can be crushed with strong force.

■ Easy transportation and superb maneuverability

- Compact crawler undercarriage is adopted, facilitating job site access/exit.

■ Semi-Automatic Material Feeding Control is installed

- The Komatsu original controller optimizes material feeding amount to the crusher.
- Plate feeder with speed controller keeps the operation of crusher uniform and stabilized. Thus, unmanned operation is possible.
(BR100JG, BR380JG, BR580JG)

■ Simple control and easy operation

- Raising/lowering of belt conveyor and removal of foreign materials are easy.
Crushing work is facilitated by preventive functions of macadam accumulation and debris clogging.
(BR100JG, BR380JG, BR580JG)

■ Options for more effective system

- Ample powered hydraulic-driven optional equipment is available, such as a magnetic separator (chassis mounted), vibratory screen and secondary/tertiary belt conveyors etc., to provide an effective system.

■ Low-noise and low vibration design

- Low-noise type engine; sound absorbing material; low-speed high-torque type hydraulic pump; soundproof muffler, etc., are adopted. Thus, overall noise level is low.

■ Highly reliable hydraulic drive system

- Crusher, feeder and belt conveyor are driven respectively by independent hydraulic pumps, assuring high reliability and easy maintenance.

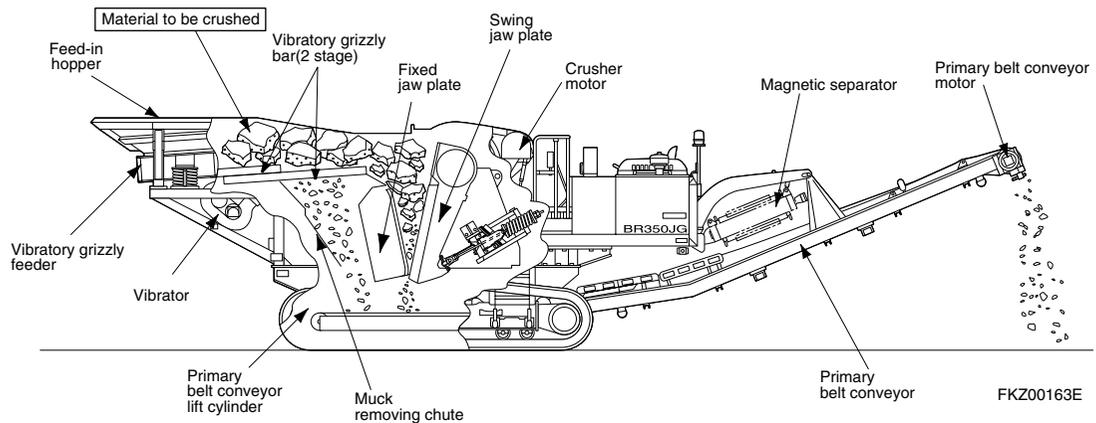

Komatsu mobile crushers are classified into 3 types.

The jaw crusher can crush large blocks and is suitable for crushing concrete debris and natural stone. It has a swing jaw plate and fixed jaw plate. Those jaw plates crush material.

The impact crusher is used for secondary crushing and granulation of asphalt, concrete debris, and natural stone. It produces round grains in many cases and is suitable for production of relatively fine grains. The blocks put in the impact crusher are thrown in the tangential direction by the blow bar of the rotor which is rotating at high speed and are crushed by collision with the impact plate. They are also crushed by collision with each other.

The shear shreds industrial waste as well as bulky domestic refuse to reduce its volume, thereby contributing to extending the service life of disposal sites.

* at transportation

Calculation of the production capacity of a mobile crusher varies largely with the type of the crusher, properties of supplied material and rocks, quantity of muck in the material, clearance of discharge setting, rotation speed of the crusher, and size of the products required by the customer, etc.

The following are the basic elements for calculation of production capacity of each crusher.

■ Relationship between elements for calculation of production capacity of jaw crusher

Production capacity	Large > Small		Remarks
Clearance of discharge setting	Wide	Narrow	
Hardness of material	Soft	Hard	Hard material may crush easily
Ratio of muck in material (in crusher)	Low	High	
Wetness of material	Dry	Wet	
Impurities in material	Less	Many	
Supply rate in crusher	–	High	Efficiency becomes highest when supply rate is 60 – 70% of volume of crusher.
Size of material	Small	Large	

* When recommending production capacity, confirm the properties of the rock samples from the customer's quarry by crushing them actually.

Forest Machines by Komatsu Forest	9-2
---	-----

Komatsu Forest AB is an international group with its head office and technology center in Umea, Sweden. Komatsu Forest produces the Valmet brand of forestry machines and is one of the world's largest manufacturers of forestry machines. Komatsu Forest has approximately 1,100 employees and is represented on all markets where mechanized forestry is used. The company includes the two manufacturing units Komatsu Forest AB Sweden and Komatsu Forest LLC USA. Komatsu Forest has its own sales companies in Australia, Brazil, Finland, Norway, the United Kingdom, USA, Sweden and Germany. Komatsu Forest AB is owned by the Japanese company Komatsu Ltd.

HARVESTERS

CONTENTS

Features 9A-2
Specifications 9A-3
Dimensions 9A-5
Installation Kit for Valmet Harvester Heads 9A-6

- **Powerful and efficient engine**

Specially developed engines for forest machines. Six-cylinders turbo diesel with electronic common rail fuel injection which produces a rapid response to increased loads. As it has been specially developed for forest machines, it delivers maximum torque even at low revs. The engines has also been provided with optimized cooling with a computer-controlled fan that detects the temperature. This results in maximum performance combined with reduced fuel consumption. All machines with power outputs in excess of 172 HP (130 kW) are equipped with engines that fulfill the EU's Tier 3 requirements.

- **Fast and maneuverable crane**

The cranes are simple and robust and have hydraulic/electronic parallel action. A design with a low centre of gravity and a centrally positioned crane gives an excellent stability. The stabilizer is connected to the cabs and the cranes leveling. With the more lightweight harvester heads the cranes achieves a reach up to 11 meters.

- **Operator comfort**

Leveling produces extremely operator-friendly cabs, where the operator is always sitting flat. This consequently generates extraordinarily good ergonomics, which enable the driver to retain concentration throughout the shift without becoming tired. The slewing cab and the side-mounted crane means that the harvester head is always in focus and the visibility perfect. Low engine noise also contributes to the excellent comfort.

- **Easy maintenance**

The machines are extremely operationally reliable, which minimize the stoppages. They are also easy to maintain and just about all service work can be carried out from ground level. Daily service and checkpoints are naturally easily accessible.

- **Excellent control and information system**

The control and information system, MaxiHarvester, links together the office, the machine and industry in an effective chain. Maxi covers a large number of different programs, for example for machine control, price list management, GIS, production and working info.

Installation Kit for Valmet Harvester heads on Komatsu PC200, PC210 and PC228

Valmet installation system makes it easy to fit harvester heads to excavators. The kit provides a well-proven and complete solution that easily and inexpensively transforms an excavator into an efficient forestry machine.

The system is especially designed for Komatsu excavators and works with all harvester heads in the Valmet 300 series. The kit includes complete installation instructions, with hydraulics and electrical diagrams. The thorough documentation ensures high reliability and simplifies troubleshooting.

The installation kit provides rapid access to all necessary components, including the mounting adapter, the hydraulic lines and the electrical circuits. In addition, the kit includes important details for increased operator safety.

FORWARDERS

CONTENTS

Features 9B-2
Specifications 9B-3
Dimensions 9B-5

- **Powerful engines and a great pulling force**

Six-cylinders (four in 830.1) turbo diesel with electronic common rail fuel injection. The engines has been specially designed for tough forest work and delivers a powerful torque even at lower revs. This produces good traction even with a full load, with an impressive pulling force. All machines with power outputs in excess of 172 HP (130 kW) are equipped with engines that fulfill the EPA Tier 3 and EU Stage 3A requirements.

- **High stability and Mobility**

Valmet's well-known, back-to-front center pivot, with the steering joint in the front frame and the articulation in the rear frame provide the machine with extraordinary stability. Very good off-road properties means full use of the machines speed, even in sensitive forests. It creeps forward, following its tracks back and forth, and does not cut corners. The very low centre of gravity, high ground clearance and external dimensions, all contribute to the machines accessibility.

- **Outstanding loader**

Strong and fast loaders with up to 8.5 m (27'11") reach. Great reliability is ensured by the outer boom and lift cylinders, the hose routing and the hose routing between the machine and the crane. Crane maneuvering is smooth thanks to limit dampening. The crane tip solution, Valmet ProTec means a completely protected hose passage in the crane tip between the crane and grapple and a braking technique that effectively dampens grapple swing.

- **Impressive load capacity**

Valmet forwarders are true workmates and real pack mules with right qualities to guarantee high productivity. The chassis is of a sturdy design, dimensioned for high tonnages. The load capacity is up to 19.8 tons and equipped the bunk system, LoadFlex, provides an extra 1.4 m (4.6") bunk width.

- **Optimized comfort**

The cabs are ergonomically designed down to smallest detail. Visibility is always good, whether loading, driving or unloading. Everything is close at hand for the operator, even though the cab is unusually spacious inside. Valmet cabs are known for low noise and vibration levels. A good operator environment allows operators to concentrate better throughout their work shifts and remain highly productive.

- **Intelligent control and information system**

Valmet Forwarders are fitted with the intelligent and easy-to-use MaxiForwarder control system. It controls all interaction between the machine, the transmission and the crane and ensures that the operator always get the most out of the machine. Operating data collection and production reports are included in the system, which even provides information about forwarders status, running time and total production volume.

- Unique set-back boom design offers a greater working range. Numerous boom options ranging from 6.53 m – 9.42 m (21'5" – 30'11"), provide excellent lift capacity and a wide cutting sweep for long reach harvesting or felling.
- Powerful engine meet Tier II emissions standards. Renowned for producing high torque at low RPM, SisuDiesel reduces noise, vibration and heat, while delivering dramatic fuel savings.
- Load sensing hydraulics apportions flow where you need it, when you need it.
- Easy service access. Lockable enclosures allow easy access and ground-level servicing at all routine service points.
- Purpose-built forestry carbody and track drive system with independent closed loop hydrostatic drive.
- Larger, taller front window improves the operator's line of sight and increases tree-top view (sky window is optional).
- Control system and gauges are ergonomically positioned into a new, fully integrated non-glare dash board.
- Certified cab is safe, comfortable and spacious with extra storage space. New electronic controls eliminate hydraulic oil pilot lines in cab.
- IQAN carrier control system developed for the EX-Series, makes these the smoothest track machines ever.
- The EX-Series is flexible allowing you to equip your machine as a harvester or a feller buncher. Fit the attachment type that is right for your job.
- EXL models feature the legendary. Timbco 2-cylinder, 4-way leveling system the industry's gold standard for simplicity reliability and value. With over 5 million hours logged this proven leveling system will take you up the steepest scopes and bring you back down safety.

SECTION **10**

GENERATOR SETS

CONTENTS

Features 10-2
Specifications 10-3

1. New Engine

Komatsu "Air-to-Air Aftercooled Engine" has been introduced. (Except for EGS45-5 to EGS300-6 , and EGS650-6)

- High Output (Performance)
- Low Fuel Consumption
- Low Noise
- Lighter Weight and Compactness
- Longer Oil Change Interval
- Easy Maintenance
- High Quality, High Reliability, High Durability

2. Easy Operation and Control

2-1.Engine & Generator control panel is arranged in one box, and located in front of Generator.
So the operator can monitor the operating status easily by viewing the meters.

Advantage:

- Simple : Minimized control equipment and wiring
- Easy Maintenance

2-2.Compact Engine Control Unit

EGS Series generators have a compact engine control unit (1 box type) for easy operation and maintenance.

Advantage and Functions

- Microprocessor : Control status and factor are programmed in Microprocessor.
- High Reliability : Engine control circuit is integrated in printed boards.
- Easy selection : A Mode Key Switch for Off / Auto / Manual
- Built-in AMF function : Auto Start / Stop, Cranking with attempts and Cool running are Standard Function.
- Iconic, Symbols and LED : Operating process and Alarm condition can be monitored.

3. High qualified electricity with Brushless, Self-excited AC Alternator

- Maintenance-Free : Brushless, Direct coupling with engine
- High Electric Characteristic : Standard 2/3 pitch windings avoid excessive neutral currents.
- Excellent Voltage Build-Up : Originally designed excited field system and high efficient steel
- Stable Voltage Regulation : Built-in type Automatic Voltage regulator (AVR)
- High Efficient Cooling : Class H insulation with forced air-circulation
- Permanent Magnet Generator (PMG) (Optional) : PMG systems provides constant excitation
- Voltage Adjustment (Optional accessory by model) : The voltage can be adjusted manually.
- Dual Voltage (Optional) : Two kinds of voltage can be given.

4. Safe Running (Protection)

- MCCB (Molded Case Circuit Breaker) can be opened by Over Current automatically.
- The engine can be stopped by High coolant temperature / Low oil pressure automatically
- The engine can be stopped by Over speed .
- Engine stop system : Energized in Run mode
The engine can be stopped automatically in case of the following condition.
(1) Over speed, (2) High coolant temperature, (3) Low oil pressure, (4) Emergency button is pushed.

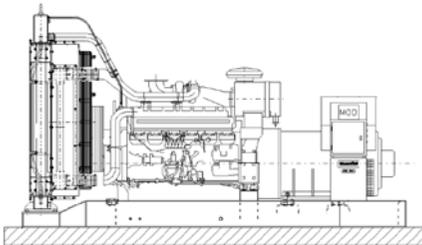

5. Various Generator Type

EGS Series Generator has 4 types.

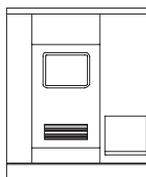

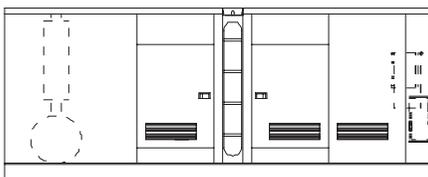

- (1) Bonnet & Soundproof type with Control panel and MCCB : For single operation at residential area
- (2) Non Bonnet type with Control panel and MCCB : For single operation in the room
- (3) Non Bonnet type with Engine control panel : For parallel operation in the room

* Typical Generator Type

Open type for Single operation

Bonnet & Soundproof type

NOTE: Output Rating

- 1) Prime rating applies to continuous power supply. Intermittent overload up to the standby rating is allowed.
- 2) Standby rating is applicable for supplying electric power in the event of normal utility power failure.
No overload capability is available for this Standby rating.
This rating may be used for continuous service as long as the emergency lasts. (Approximately 1 hour.)
- 3) Performance : Horsepower represents of S.A.E. J1349 standards.
- 4) Barometric pressure : 743 mmHg, Temperature : 25°C (77°F), Water vapor pressure : 7.5 mmHg

NOTE: Output Rating

- 1) Prime rating applies to continuous power supply. Intermittent overload up to the standby rating is allowed.
- 2) Standby rating is applicable for supplying electric power in the event of normal utility power failure.
No overload capability is available for this Standby rating.
This rating may be used for continuous service as long as the emergency lasts. (Approximately 1 hour.)
- 3) Performance : Horsepower represents of S.A.E. J1349 standards.
- 4) Barometric pressure : 743 mmHg, Temperature : 25°C (77°F), Water vapor pressure : 7.5 mmHg

Specifications 11-3

Engine Used in KOMATSU Machines

by Engine Model 11-4

High Altitude Deration 11-6

High quality:

The Komatsu diesel engine is a true achievement of our total engine production system—from casting all the way through machining processes using Komatsu-made machine tools to the final steps of assembly.

Proven reliability

The Komatsu diesel engine is matched with our heavy-duty construction equipment to create a powerful combination of unbeatable performance and high durability.

Economical operations:

The Direct injection system and special fuel-minimizing design of Komatsu diesel engines provide maximum economy. Low lubricant consumption is also a remarkable advantage.

Compact design:

Advanced design and an efficient production system make Komatsu diesel engines compact and lightweight, enhancing their versatility.

Low-noise operation:

Ideal designs keep engine noise and vibration to a minimum.

Wider applications:

A wide range of optional equipment offers a variety of applications to meet specific customer requirements.

Low emission engine:

Komatsu engine meets the emission regulations of North America, Europe, Japan, etc. by employing the advanced technologies. The followings are examples of the technologies.

High-pressure injection system

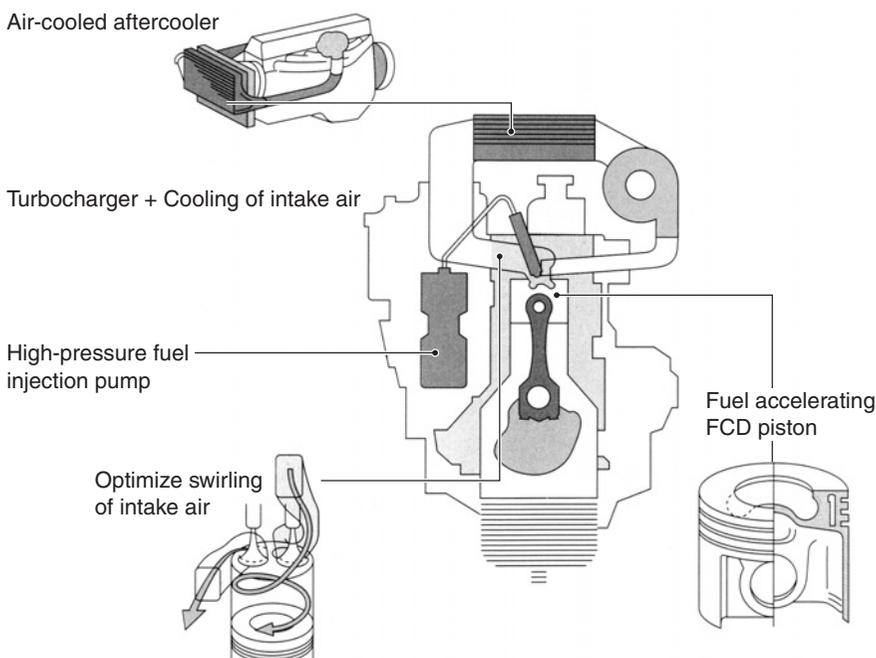

Fuel is sprayed more finely to prevent increase of NO_x and particulate matter by heightening the fuel pressure injected into the cylinder.

Air-cooled aftercooler

Intake air temperature pressurized by the turbocharger is lowered largely by the air-cooled aftercooler having high cooling capacity to prevent increase of NO_x caused by high combustion temperature and increase the intake air density for less fuel consumption.

Optimized shape of combustion chamber by use of FCD piston

The shape of the combustion chamber is optimized by employing an FCD piston having high strength and the air flow speed is heightened by improving the shape of the air intake passage. With these technologies, particulate matter is reduced.

Komatsu low-emission diesel engine

NOTE: (1) The percentages listed above are for standard machines.
(2) These values at each altitude range indicate the percentage of the fueling deration rate against standard fueling calibration. 100 percent means that no fuel derate is required.
(3)*: With automatic altitude deration
(4)*: Automatic deration depending on altitude and turbo inlet air temperature (ambient temperature) Applied only to SAA12V140E-3

Tire Manufacturer's Designation 12-3

Tire Knowledge:

- Tire size designation 12-4**
- Structure and function of tire 12-4**
- Comparison of bias and radial tires 12-7**
- Tread pattern 12-8**
- Depth of tread groove on rock-type tires 12-8**
- TKPH (TMPH) 12-8**
- Tire characteristics 12-9**
- Tire identification 12-10**

Tire Selection 12-11

Service	TRA classification	Tread	Use
Earthmover	E-1	Rib	For front wheels of dump trucks
	E-2	Traction	For scrapers used on sandy ground and soft soil where traction is necessary.
	E-3	Rock	For dump trucks and scrapers used where resistance against external damage and abrasion is important.
	E-4	Rock Deep Tread	For scrapers and dump trucks used where resistance against external damage and abrasion is required.
	E-7	Flotation	For carry-all scrapers stronger than E3, used where only flotation is needed.
Grader	G-1	Rib	For front wheels of graders.
	G-2	Traction	For rear wheels of graders used where traction is necessary.
	G-3	Rock	For rear wheels of graders used where resistance against external damage and abrasion is necessary, rather than traction.
Loader	L-2	Traction	For loaders and dozers used on sandy ground where traction is necessary.
	L-3	Rock	For loaders and dozers used on mountain sand and on rocks where resistance against external damage and abrasion is necessary.
	L-4	Rock Deep Tread	For loaders and dozers used where resistance against external damage and abrasion is required to be stronger than those of L3.
	L-4S	Smooth Deep Tread	For loaders and dozers used where resistance against external damage and abrasion is required to be stronger than those of L-3S.
	L-5	Rock Extra-Deep Tread	For loaders and dozers used where resistance against external damage and abrasion is required to be stronger than L4.
	L-5S	Smooth Extra-Deep Tread	For loaders used where resistance against external damage and abrasion is required to be stronger than that of L-4S.
Compactor	G-1	Smooth Tread	For Tire rollers
Log-skidder	G-1	Intermediate	For skidder

* : For Rigid Dump Truck

● : For Articulated Dump Truck

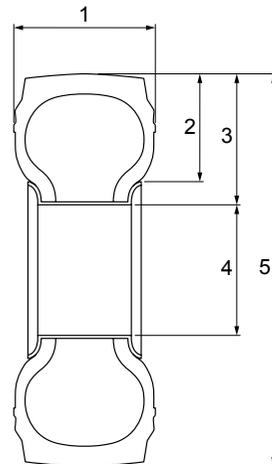

1. TIRE SIZE DESIGNATION

Indicating dimensions of tire:

Generally speaking the designation of tires refers to their size in inches and their ply rating (PR). The size of a tire means the width of and the diameter of the rim (inside diameter of tire), while the ply rating shows the strength of the carcass.

1. Tire width (cross-sectional width)
2. Tire height
3. Cross-sectional height
4. Rim diameter
5. Tire outside diameter

Bias	Nominal tire width 24.00	-	Nominal rim diameter 49	-	Ply rating 48PR
Radial	Nominal tire width 24.00	-	Nominal rim diameter 49	-	Star mark ★ ★

FVBH0367

Nowadays the ply rating shows the strength of the tire; it no longer shows the number of layers of cord cloth. Originally the term "ply" did in fact refer to the number of layers of cord cloth, and was therefore an indication of the tire strength. But with the development of new materials, the original cotton cord cloth changed first to rayon and has now been replaced by nylon or steel wire.

This has made it possible to greatly increase the strength without increasing the number of layers of material. Consequently the term "ply rating" has come to be used to indicate the strength of the tire rather than to express the actual number of plies.

Stars (*, **, ***) are used to indicate the strength of radial tires.

2. STRUCTURE AND FUNCTION OF TIRE

2-1 Conventional Tire

a) Tread

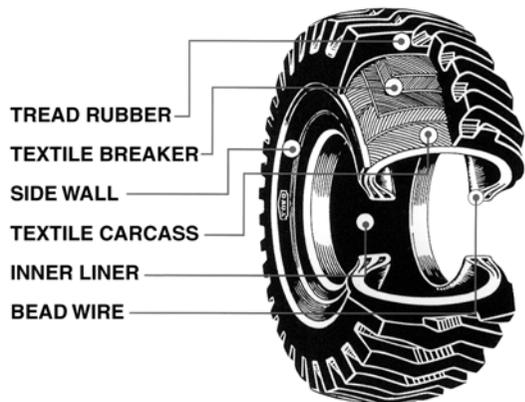

The tread compound used is resistant to abrasions and cuts. Tread patterns give the tire good traction, longer serviceability and higher resistance to cutting.

b) Breaker

Extra layers of rubber-coated cord are placed between the outer plies and the tread. They prevent cuts reaching the ply cords through tread, and absorb shocks.

c) Plies

A tire is composed of several layers of plies, coated on both sides by a rubber compound. These maintain inflation pressure of the tires supporting load. These plies are made of high tensile nylon cord.

The term "Ply Rating", according to the Tire and Rim Association (TRA), is defined as follows:

"A given tire with its maximum recommended load when used in specific type service. It is an index of tire strength and does not necessarily represent the number of cord plies in the tire."

d) Inner liner

The inner liner is a rubber layer covering the inside from bead to bead of a tubeless tire, corresponding to the tube of an ordinary tube tire. It prevents the loss of inflation pressure of the tire.

e) Beads

Beads are the parts which fix the tire to the rim. All plies are tied into bundles of steel wire. The beads fit on the rim perfectly, preventing the tire from slipping out of the rim contour while the vehicle is in motion.

f) O-Ring (rim packing)

When the tire is inflated this rubber ring prevents air breaking through gaps in the rim.

g) Side-walls

Side-walls are covers made of a flexible rubber compound to protect the sides of the tire. Side-walls are designed to cushion the plies from shocks and cuts, and to flex and bend without cracking, under ordinary usage.

h) Tubes and Flaps

Function of the tube is to retain air or inert gases under pressure within the cord body. The flap protects the tube from damage by the rim and tire beads.

2-2 Shredded Wire Under Tread Tire

Shredded wire under tread tire has a special rubber layer strengthened by the shredded wire between the tread and breaker. The shredded wire rubber-layer has the following benefits.

- (1) Protects against cuts, not only reducing repair expenses, but improving the overall performance of vehicles.
- (2) Prevents small cuts from spreading.
- (3) Prevents penetration into the tire of water, dust, mud and pebbles, which can lead to cut-separation.
- (4) Cut-free strength ensures a greater number of recaps.

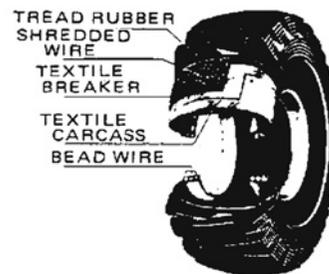

Fig.3 Construction of shredded wire under tread tire

2-3 Steel Breaker Tire

Rock pattern tires often feature breaker material. The breaker was changed from nylon to steel in order to resist cuts and cut bursts.

- (1) Tread cuts do not extend to bursting.
- (2) Puncturing of tires is reduced.
- (3) There is less carcass damage to the tire so that tire can be re-treaded many times.

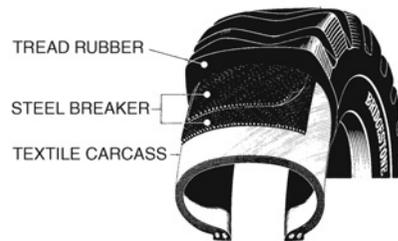

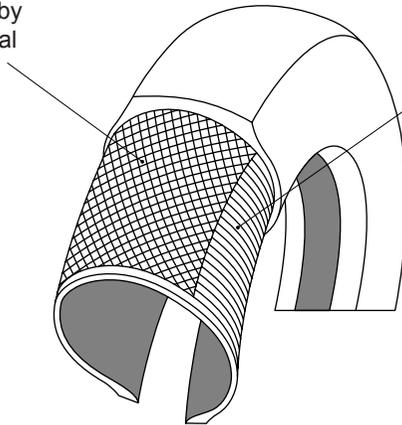

Fig.4 Construction of steel breaker tire

2-4 Side Steel Breaker Tire

In this tire the steel breaker is extended to the side-wall of the tire to protect it against side damage. The construction is similar to that described above.

2-5 Radial Tire

The crown is stabilized by a belt made up of several plies.

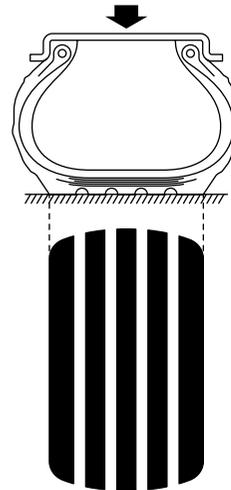

The casing has only one radial ply.

FVBH0370

The side-wall and tread areas function separately. The tread is unaffected by the flexing of the side-walls, so there is:

- less deformation of the tire contact areas on the ground ;
- less friction with the ground.

There is no movement between casing plies.

FVBH0371

3. COMPARISON OF BIAS AND RADIAL TIRES

3-1 Structure and features of tires

	Structure of radial tires	Structure of bias tires
Carcass	The carcass cord faces in a radial direction (at 90° across the tire). • There is one layer (ply)	The carcass cord faces at bias (angle to the tire). • Several plies are placed on top of each other and at an angle to each other.
Side wall	Only a single ply is used, so the side wall is flexible. • To improve the resistance of the side wall to cuts, the carcass is turned up.	The plies are placed on top of each other at an angle, so the side wall is thick.
Tread	To distribute the load around the circumference there is a steel belt layer which gives the tread high rigidity.	A breaker is used to protect the carcass and to prevent the tread and carcass from separating (Normally, a nylon breaker is used. Steel breakers are not suited for high speed travel.)
Bead	Single bead structure	There are multiple plies, so there are also multiple beads. (For dump trucks, there are normally three).
Tire inflation pressure	Because of the structure of the tire, the inflation pressure is higher than with bias tires.	Normally 5 - 7 kg/cm ²

3-2 Suitable tire

Feature required	Suitable		
	Radial	Bias	
Wear life	○		
High speed travel (heat resistance)	○		
Cut resistance	Penetration resistance	○	
	Sidecut resistance		○
Fuel consumption	○		
Travelability (traction, flotation) Riding comfort	○		
	○		
Cost	Initial cost		○
	Operating cost	○	

4. TREAD PATTERN

The tread pattern can be divided broadly into the type in Fig. 1, which has no circumferential groove in the tread center, the type in Fig. 2, which has transversal grooves, and the type in Fig. 3, which has a block pattern. Generally speaking, the first type provides excellent resistance to cutting and wear, while the second type provides excellent traction on slippery surfaces. The block pattern is typical of radial tires giving good all round performance.

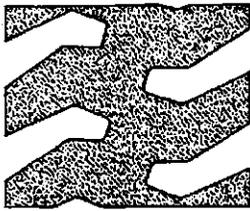

Fig. 1

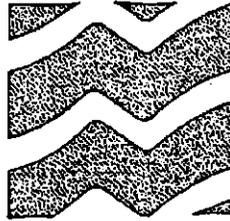

Fig. 2

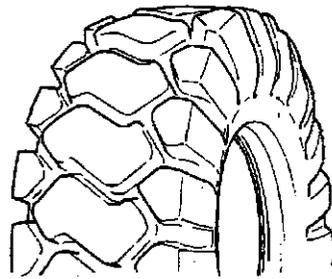

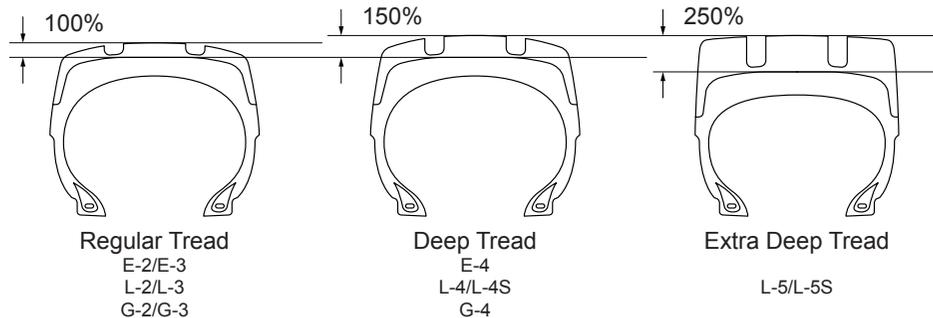

Fig. 3

5. DEPTH OF TREAD GROOVE ON ROCK-TYPE TIRES

There are the following depths of grooves for dump truck tires. The main feature of the deep groove tire is the large amount of wear tolerance.

Table 2-2

Category of groove depth	TRA code	General use	Groove depth
General groove	E3	Hard soil, general	100
Deep groove	E4	When it is necessary to have greater resistance to external damage and resistance to wear than with E 3.	Approx. 150

FVBH0369

6. TKPH (TMPH)

The primary task of heavy-duty tires is to haul heavy loads faster and over longer distances. This heavy load hauling inevitably results in heat built-up inside the tires, and tires have limitation of temperature.

If this limitation is reached, deterioration of the tire will begin at an early stage of operation. Accordingly, it is necessary when selecting tires, to determine the amount of work will keep the tire within a safe range to avoid over-heating when a vehicle is operated under given conditions.

The amount of work done under the given conditions and within a safe range is shown as the "TON-KILO-PER-HOUR" ("TON-MILE-PER-HOUR") which can be determined by the following formula:

TKPH(TMPH) = (Average tire load) × (Average speed)

Average tire load = 1/2 (tire load when vehicle carries no load + tire load when vehicle is loaded)

Average speed = $\frac{\text{round trip distance} \times \text{number of job cycles per day}}{\text{total hours of operation per day}}$

- Total hours of operation include recess and dead time.

7. TIRE CHARACTERISTICS

The optimum tires should be selected for their applicable operation or job and terrain conditions depending on the cutting (wear) resistance and heat resistance. These resistant qualities are indicated as follows:

(1) CR (cutting resistance)

Excellent durability against cuts and wear due to excess road crown, imbedded or loose rocks, sharp objects, etc.

(2) HR (Heat resistance)

A resistant quality against the internal heat generation makes a machine suitable for long hauls.

(3) GP (General purpose)

Tires having medium degree of the above resistant qualities, CR and HR.

(4) Shredded wire under tread and steel breaker types

These types of tires are made more durable against cuts than the CR with special precautions to limit tire wear and cutting by incorporating the layer of steel cord between tread and casing, or by providing a cord - reinforced rubber interlay between the tire cover and plies to shield the plies against penetration by sharp objects.

Selection of tires to match required characteristics (tire structure, quality of rubber)

Specification	Tread rubber quality			Structure		
	Standard	Heat resistance	Cut resistance	Nylon breaker	Steel breaker	Side steel breaker
Wear resistance	○	△	⊙	○	○	○
Cut resistance	Tread	○	△	○	⊙	⊙
	Side	○	○	○	○	⊙
Heat resistance	○	⊙	△	○	△	△
Traction, flotation	○	○	○	○	○	○

⊙ : Excellent ○ : Good △ : Fair

Because of the structure and quality of the rubber used for the tread, cut resistance and wear resistances are mutually opposite to heat resistance, so when selecting tires, always check the TKPH.

Depending on the tire, super heat-resistant (SHR) and super cut-resistant (SCR) tread rubber are available, so ask your tire distributor for details of tires that are not listed in the operation manual.

8. TIRE IDENTIFICATION

Tire characteristics	BRIDGESTONE	MICHELIN	YOKOHAMA	TOYO
CR (Cut-resistant)	2A (cut-resistant) 2V* (Special cut-resistance) 2Z* (Special cut-resistance)	A4 A	CP (Cut protected) CP-C (Cut protected specification) CP-S (Cut protected and reinforced specification)	CR (Cut-resistant)
GP (General purpose)	1A (Standard)	B4 B	REG (Regular) PE-R (Regular specification) RE-T (Regular heat-resistant specification)	SP (Standard purpose)
HR (Heat-resistant)	3A (Heat-resistant)	C4 C	HR (Heat resistant) HR-H (Heat-resistant specification) HR-V (Heat-resistant and reinforced specification)	HR (Heat resistant)

* Bias tire only

Code identification for MICHELIN tires

Type A4: Particularly resistant to cuts, tread tearing and abrasion on very rough surfaces.

Type A: Particularly resistant to cuts, tread tearing and abrasion at average speeds which are higher than those for A4 (above).

Type B4: Compromise solution between abrasion resistance and average speed on rough surfaces. (available in sizes 49 inch rim diameter and above)

Type B: Higher resistance to internal heat generation on surfaces which are not particularly rough.

Type C4: For running on long cycles at high speeds on well maintained roads.

Type C: Very high resistance to high average speeds on long cycles run on well maintained roads

Code identification for GOODYEAR

Compound Code	Compound Type
2	Ultra Heat Resistant
3	Heat Resistant
4	Abrasion Resistant
6	Ultra Abrasion Resistant

Construction Code	Construction Type
S	Standard
H	Heavy Duty
HR	Heavy High Speed
HW	Extra Heavy Duty

Selecting tires suitable to working conditions (Structure of tire and quality of rubber)

Examples of procedure for selecting tires of dump truck and wheel loader

		Procedure for selecting tires		
Dump truck	(1) Carrying material in mine (limestone) or stone crushing pit (RDT, ADT)	Tires generate little heat Tires have high chance to be cut	Cut resistance Abrasion resistance	Deep-groove (E-4) Cut-resistant rubber Steel breaker
	(2) Carrying material in mine (coal, iron ore, etc.) (RDT, ADT)	Tires generate much heat Tires have medium chance to be cut Working speed is high	Heat resistance Abrasion resistance Cut resistance	General-groove, deep-groove E3, E4 Heat-resistant tread rubber Radial structure
	(3) Carrying material in dam construction or civil engineering field (RDT, ADT)	Tires generate much heat Tires have medium chance to be cut	Heat resistance Abrasion resistance Cut resistance	General-groove, deep-groove (E3, E4) Heat-resistant tread rubber Radial structure
	(4) Carrying material on soft (muddy) ground (ADT)	Tires generate little heat Tires have high chance to be cut Ground pressure is low	Cut resistance High floating performance Abrasion resistance	General-groove, deep-groove (E3, E4) Heat-resistant tread rubber Radial structure
Wheel loader	(1) Mining and collecting natural stones	Tires generate little heat Tires have high chance to be cut Abrasion life is short	Cut resistance Abrasion resistance	Deep-groove or ultra deep-groove (L-4, L-5) Cut-resistant tread rubber General-groove (L3) + Steel breaker or side steel breaker
	(2) Loading products of mine or stone crushing pit	Tires generate little heat Tires have low chance to be cut Abrasion life is long	Durability of carcass Crack resistance (Deterioration)	General-groove (L3)
	(3) Loading and carrying sand and gravel	Tires generate little heat Tires have little chance to be cut Abrasion life is long	Durability of carcass Crack resistance Traction	General-groove (L3) Traction (L-2)
	(4) Load and carry operation	Tires generate much heat Tires have little chance to be cut Abrasion life is long	Heat resistance Crack resistance	Heat-resistant tread rubber General-groove (L3) Traction (L-2)

NOTE: Some tires in the above table cannot be selected for some destinations.

CONTENTS

Introduction	13A-2
Recommendation for Low Grade Fuel Usage	13A-3
Recommendation for Sandy and Dusty Terrain Condition	13A-4
Recommendation for High Altitude	13A-5
Recommendation for Cold and Extremely Cold Weather Area	13A-7
Tropical Weather Specification	13A-9

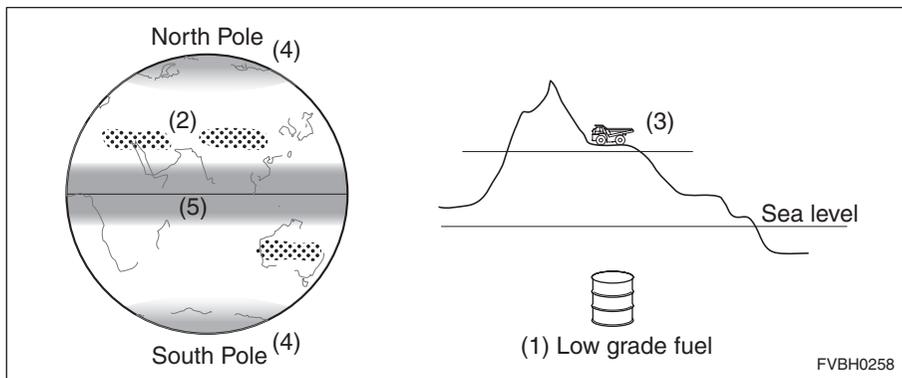

KOMATSU products are designed to meet various application requirements in a wide range of natural environment and social situations on the globe. For operation under extremely severe environmental conditions, where the mere standard spec is inadequate, KOMATSU offer a variety of options for special application to be added to or substituted for the standard spec so as to reach the full potential of the machine even in such conditions.

Machine operating conditions that require special care are as follows:

- Fuel quality: (1) areas where low grade fuel is generally used
- Ambient air quality: (2) areas where sand/dust will be thickly blown up
- Altitude: (3) areas at very high altitudes
- Ambient air temperature: (4) areas whose climate is cold or frigid, (5) tropical regions

In this chapter, why such special care is necessary and what are in the special spec are explained with typical examples.

It is recommended to consult KOMATSU through the distributor for actual choice of a spec for such special application.

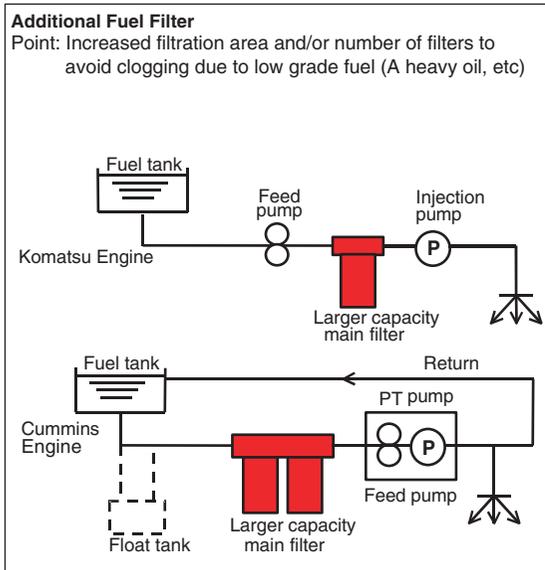

The quality of fuel depends on the districts and fuel suppliers. In addition, if the fuel is stored under bad condition, its quality may be lowered.

1) Dirt

Since dirt in the fuel clogs the filter quickly, it can lower the engine power. In addition, it can lower circulation of the fuel and wear the internal parts of the injection pump quickly. To solve this problem, a filter of finer mesh should be used or the number of filters should be increased.

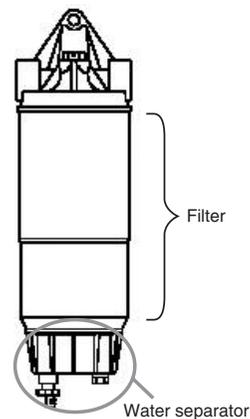

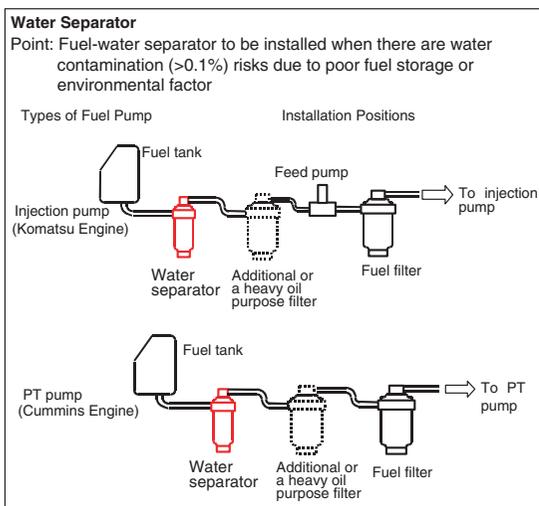

(Additional fuel filter for low grade fuel)

This figure shows an example.
It is not applicable to every model.

2) Water

Water in fuel rusts the fuel piping. In addition, it lowers lubrication performance, and that wear the sliding parts of the injector, injection pump, etc. To solve this problem, a water separator should be installed.

Example) Filter and water separator unit

3) Sulfur

If fuel contains sulfur, sulfuric acid is produced and it accelerates internal corrosion. If it is obliged to use fuel containing sulfur by 0.5% or more, use high TBN (Total Base Number) oil.

If fuel containing sulfur is used, the oil is deteriorated quickly and it should be replaced at shorter intervals. For detail, see MAINTENANCE in the Operation & Maintenance manual.

Recommendation for Sandy and Dusty Terrain Condition

FOR SEVERE ENVIRONMENTS

This specification should be applied to not only sandy terrain but also dusty terrain. It is essential when the view range is 0 meter.

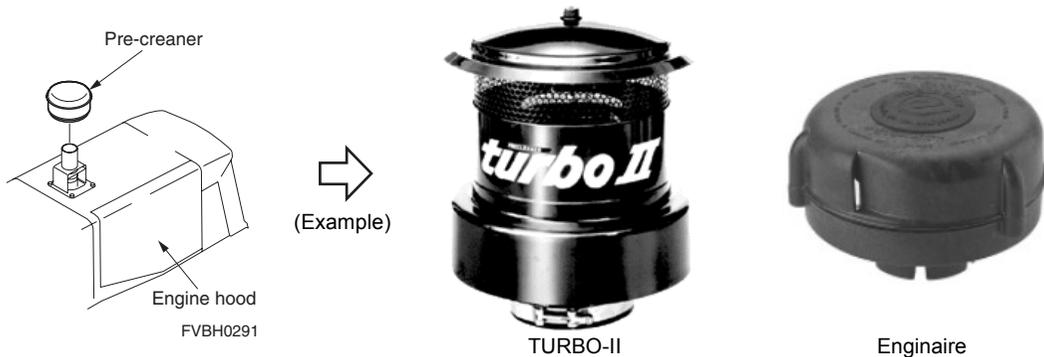

1) Quick clogging of air cleaner

If the air cleaner is clogged quickly, the engine power lowers, the exhaust temperature rises, and wear of the internal parts of the engine is accelerated. If the exhaust temperature rises above the allowable level, the cylinder head may crack and the valves may melt.

In addition, the rotating parts are worn quickly and the radiator core fins are also worn quickly by the collision of grains of sand. The radiator dust-proof grid is prepared to prevent quick wear of the radiator core fins. It is not necessary, however, if the hydraulic suction fan is installed.

2) Cyclone-type pre-cleaner

While the dust accumulated in the conventional US pre-cleaner must be removed by hand, the dust swirled and sucked into TURBO-II and Enginaire (as example) are discharged automatically by a centrifugal force.

3) 5-stage dust indicator

The 5-stage dust indicator shows how much the air cleaner is clogged and if the air cleaner can be used again after it is cleaned.

(Example)

Conventional type

OK/NG (not OK) display only

New type

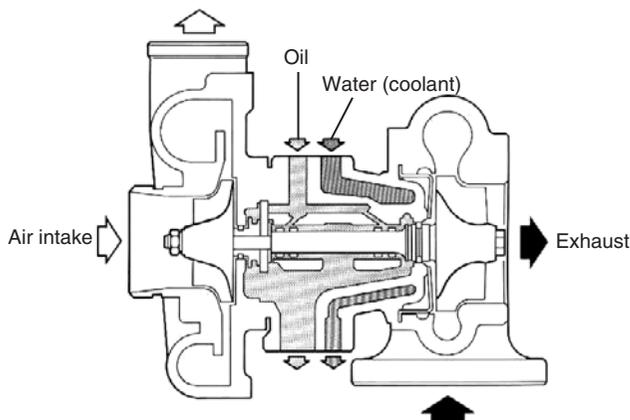

New part number: 08672-01000
(Current part number: 600-184-1920)
<The main unit and connectors are set.>

Negative pressure display part
The clogging state is self-evident from the five stages scale displayed on the yellow display unit.

The air cleaner element must be replaced with new one after it is cleaned 6 times. If this new indicator is used, however, the air cleaner element can be replaced according to its clogging condition. As a result, the maintenance cost can be reduced.

As altitude is increased, air is more rarefied (atmospheric oxygen is reduced) and the quantity of fuel is increased for the quantity of air. As a result, combustion becomes incomplete and the exhaust temperature rises. The rise of the exhaust temperature can cause a serious engine trouble such as melting of the valves. In addition, the air resistance decreases and the turbocharger speed rises extremely and its lifespan is shortened remarkably.

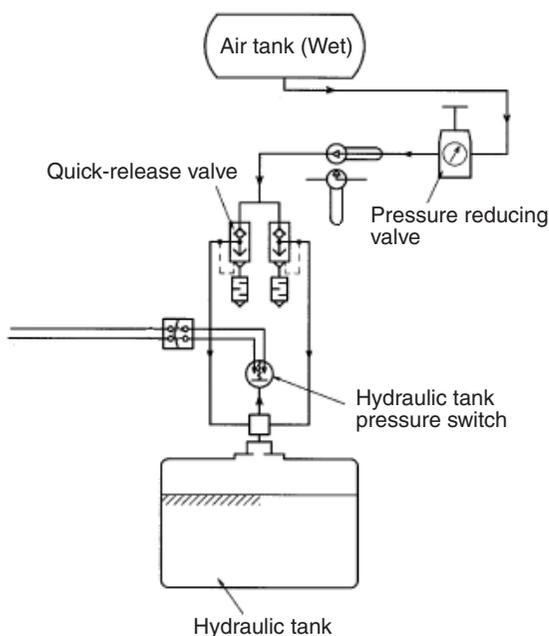

- 1) The fuel injection rate must be reduced to secure a proper air-fuel ratio for combustion. If a mechanical injection pump is employed, it must be readjusted mechanically. If fuel is controlled electronically, the software of the engine controller must be changed.
- 2) Turbocharger
 - 1) The turbocharger may need to be replaced with one equipped with an over-speed prevention device.
 - 2) The turbocharger may need to be replaced with a water-cooled one to prevent shortening of its lifespan caused by high temperature.
 (Example: Water-cooled turbocharger)

3) Pressurized hydraulic tank

As the atmospheric pressure lowers, the hydraulic oil may be aerated, and that may cause cavitation in pumps. To prevent this problem, a pressurizing system may be required.

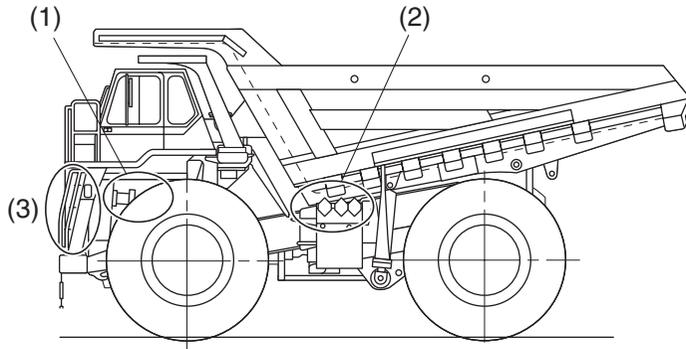

(Example: Pressurization of hydraulic tank of HD785-5)

It is reported that simple pressurization with a conventional tank cap is sufficient for a machine equipped with a hydraulic tank at a high position like a hydraulic excavator.

Necessity of pressurizing system must be checked for each model.

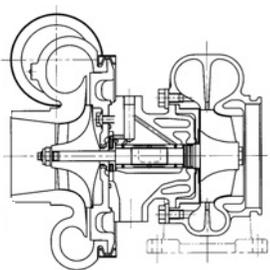

(Example: HD785-5 with high altitude specification)

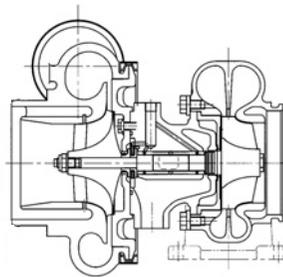

FVBH0299

1) Change of engine specifications

- Improvement of turbocharger

Current turbocharger

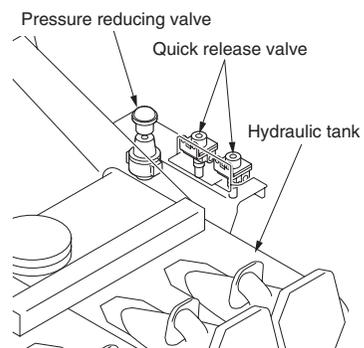

Improved turbocharger
Inlet circulation type

- Derating of engine output
Fuel injection derating: 20%

2) Pressurization of hydraulic tank

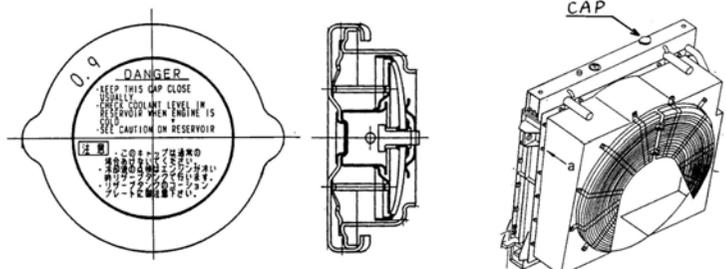

The hydraulic tank is pressurized with air to prevent cavitation caused by lowering of suction pressure of the hydraulic pumps.

FVBH0292

3) Pressurization of radiator

The radiator cap is replaced to prevent lowering of boiling point at high altitude.

Standard specification: 0.7 kg/cm² -> High-altitude specification: 0.9 kg/cm²

Recommendation for Cold and Extremely Cold Weather Area

FOR SEVERE ENVIRONMENTS

In a cold district or a cold season, the engine does not start easily because of the low temperature. The reasons for this phenomenon is that the battery lowers in function and cannot supply a necessary current and the resistance to rotation increases as the viscosity of the lubricating oil of the power train and hydraulic oil increases. In addition, if the temperature lowers below -20°C , the oil in the track rollers and final drive solidifies. As a result, the floating seals are dragged and the O-rings are broken, and that can cause internal breakage.

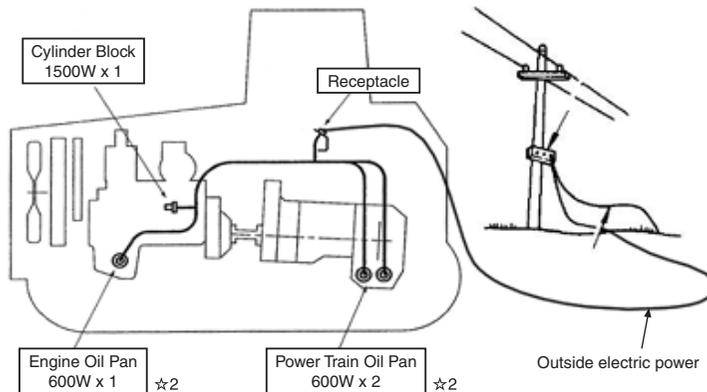

To solve these problems, the following measures are necessary.

(Example)

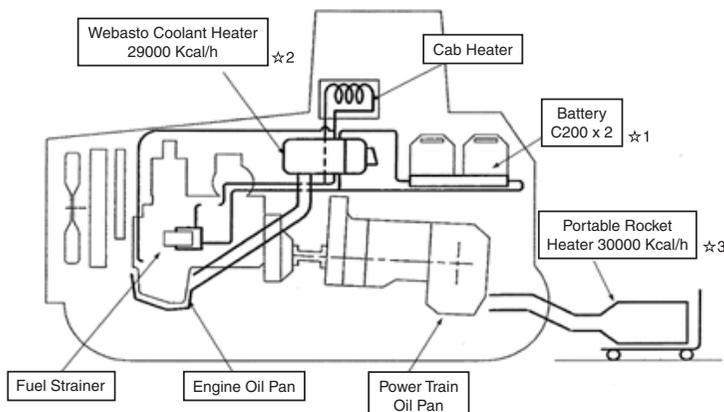

Part	Spec	Cold weather	Extremely cold weather	Note	Purpose
	Minimum ambient temp.	$-30 \sim -20^{\circ}\text{C}$	$-50 \sim -30^{\circ}\text{C}$		
Battery (☆1) Starting motor Alternator		Large-capacity Large-capacity Large-capacity	Large-capacity Large-capacity Large-capacity	Cable	Improvement of startability (On drive side)
Measures to prevent overcooling • Reversible fan		Necessary	Necessary	Since hydraulic driven fan can rotate in reverse, reversible fan is not necessary.	Prevention of lowering of power
• Radiator curtain • Radiator shutter • Ktiling		Necessary Unnecessary Unnecessary	Necessary Necessary Necessary		
Reduction of dragging torque • Oil pan heater (☆2) • Combustion heater (☆3)		Unnecessary Unnecessary	Necessary Necessary		Improvement of startability (Lowering of resistance on driven side)
Undercarriage • Employment of seals coated with nylon • Employment of oil which does not solidify even at -55°C		Necessary Necessary	Necessary Necessary		Prevention of breakage of undercarriage caused by solidification of oil

(Example) D275A-5 with extremely cold weather specification (cold weather specification for CIS)

1) Warmth keeping for easy engine start

2) Preheating system for low-temperature start

**Recommendation for Cold and
Extremely Cold Weather Area**

**FOR SEVERE
ENVIRONMENTS**

**Arctic Temperature Requirements for the Komatsu Hydraulic Mining Shovels
PC 3000 / PC 4000 / PC 5500 / PC8000**

Elements	Temperature down to -25°C	Temperature down to -40°C	Temperature down to -50°C

X = standard delivery (no changes)

If the machine is used in a jobsite where the atmospheric temperature exceeds +40°C and rises up to +50°C, the temperature of the coolant and lubricating oil may rise above the allowable limit. Under this condition, the engine and power train overheat and the lifespan of each part is shortened.

1) Large-sized radiator cooling fans

It is necessary to cool the coolant and lubricating oil properly. (Example: HD785-5, HD985-5)

2) Antifreeze

Antifreeze is not necessary naturally. Since fresh water is used, the heat balance is improved about 4°C. Corrosion resistor must be added and replaced periodically, however, to prevent rusting of inside of the engine.

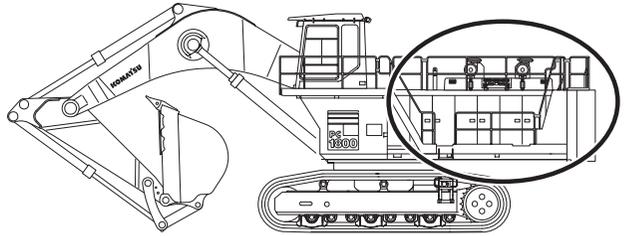

It is also important for protection of the engine to use soft water such as city water, since water in rivers and ponds is hard in many cases.

Some large-sized models for Australia can operate up to +55°C.

(Example) PC1800-6 with +55°C specification

1) Large-sized radiator cooling fan

- Increase of oil cooler capacity
- Increase of radiator capacity
- Increase of fan diameter and speed
- Improvement of air flow in engine hood (Addition of perforated cover for door on pump side and duct on radiator side)

FVPM2967A

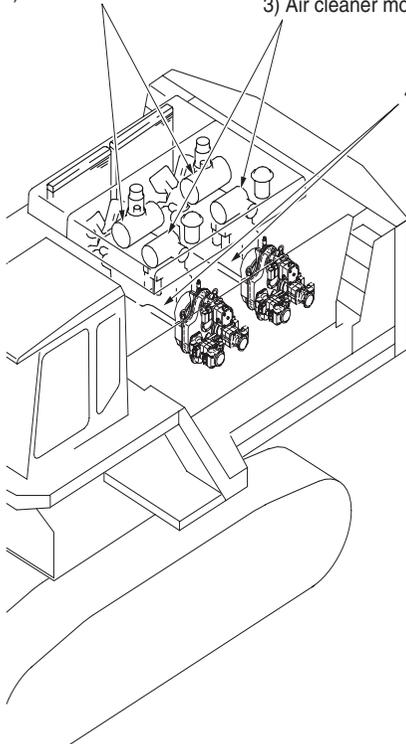

2) Muffler mounted on outside

3) Air cleaner mounted on outside

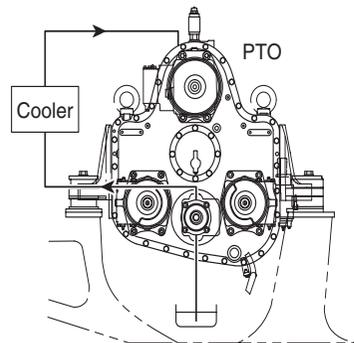

4) Heat resistant alternator

5) Additional PTO cooler (installed in front of radiator)

- 2) Muffler mounted on outside 3) Air cleaner mounted on outside

4) Heat-resistant alternator

5) Additional PTO cooler (Installed in front of radiator)

What is HAT?

- HAT=Haulage Analysis Tool
- HAT charts provide productivity figures for both loader dependent and truck dependent haulage applications.
- The productivity and unit cost figures exist for variable travel and load time scenarios.
- These comprehensive charts aid in identifying the most cost-effective fleet configuration for any given haulage application.

How to use HAT?

WA900 /HD1500

Round Trip Travel Time (min) = Haul Time + Return Time + Turn & Dump Time

FVBH0388

How to obtain Single Truck Production

1. Decide the loader cycle time and draw perpendicular Line 1 from the scale point. (40 seconds in this example)
2. Decide the round trip travel time of the dump truck and select the Line 2. (6 minutes in this example)
3. Draw Line 3 horizontally from the intersection of Line 1 and Line 2 and read the value at the point where it crosses the scale of single truck production. (790 tonnes/Hr in this example)

How to obtain Number of Truck allocatable for a loader

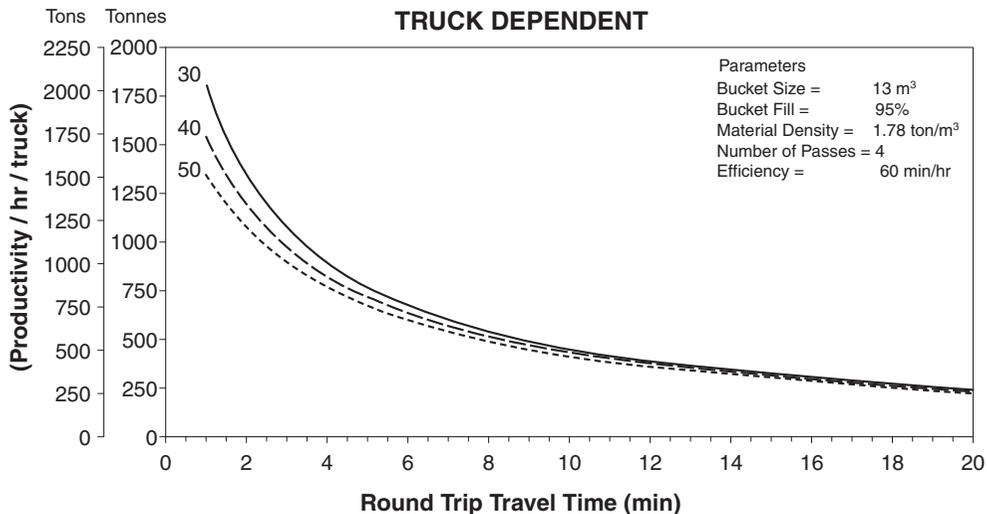

4. Determine the lower and upper limits of the round trip travel time for the given loader cycle time. (In this example, the lower and upper limit of the round trip travel time is 5.5 and 10.5 minutes respectively for the given loader cycle time of 40 seconds.)
5. Obtain the number of trucks allocatable for a loader.
Draw Line 6 horizontally from the intersection of Line 4 starting from the 6-minute point of round trip travel time scale and Line 5 of the loader cycle time of 40 seconds and read the value at the point where it crosses the scale of the number of trucks allocatable for a loader. The number is 3-unit in this example.
6. Read the loader production when the loader cycle time is 40 seconds from Table 1, that is 1,660 tonnes/Hr shown in a circle.

As identified above, followings can be obtained when WA900 and Hd1500 are combined for the operation with loader cycle time of 40 seconds and truck round trip travel time of 6 minutes.

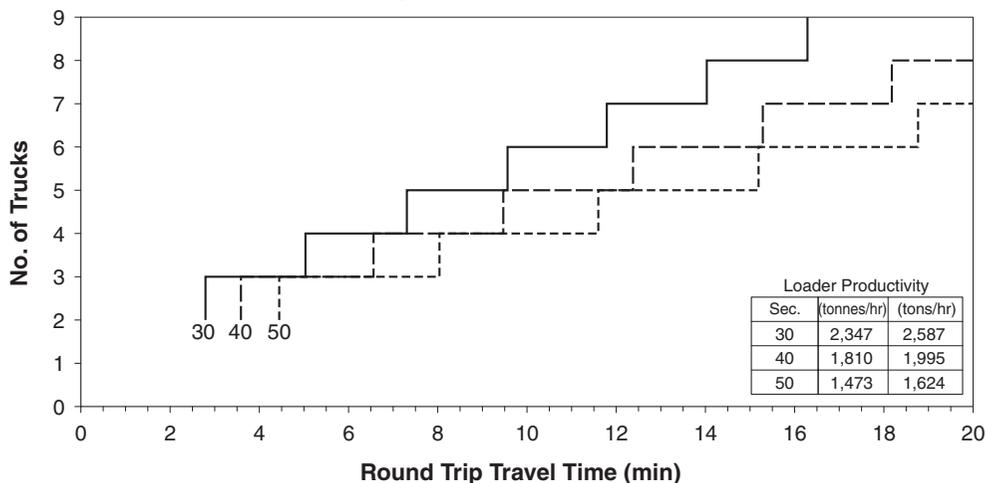

- A. From above 1, 2 and 3, the single truck production of HD1500 is 790 tonnes/Hr.
- B. From above 4 and 5, 3 units of HD1500 may be allocated for a WA900 when the round trip travel time is within 5.5 to 10.5 minutes.
- C. From above 6, The maximum fleet production is 1,660 tonnes/Hr that is equal to the loader production.

Calculation of Production	14A-2
Bulldozers	14A-4
Dozer Shovels, Wheel Loaders	14A-6
Hydraulic Excavators	14A-9
Dump Trucks	14A-13
Motor Graders	14A-20
Compactors	14A-21

When planning mechanized projects, one extremely important issue is how to calculate the production of the machines.

The first step when estimating the production is to calculate a theoretical value as explained below. This theoretical value is then adjusted according to actual figures obtained from past experience in similar operations.

On the basis of these figures (particularly those for job efficiency) it will be possible to determine values suitable for the project which will be neither over-optimistic nor wasteful.

Therefore it is first necessary to fully understand the theoretical calculations and to be able to obtain a figure for working efficiency which is feasible on that job site.

From this it is possible to obtain a realistic figure for the work volume that can be attained.

Method of calculating production

It is usual to express the production of construction machines in terms of production per hour (m³/h or cu.yd./h).

This is basically calculated from the haul volume per cycle, and the number of cycles.

$$Q = q \times N \times E = q \times \frac{60}{Cm} \times E$$

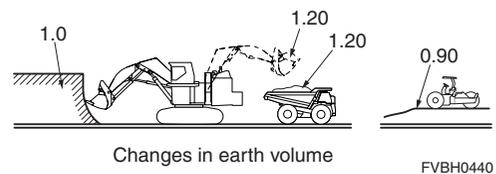

- where **Q** : Hourly production (m³/hr; yd³/hr)
- q** : Production (m³; yd³) per cycle, of loose, excavated soil (This is determined by the machine capacity.)
- N** : Number of cycles per hour = $\frac{60}{Cm}$
- Cm** : Cycle time (in minutes)
- E** : Job efficiency (see the item 2)

1. Earth volume conversion factor (f)

The volume of any amount of earth depends on whether the soil is in its natural ground condition (that is, unexcavated), whether it is loose, or whether it has been compacted.

This conversion factor depends on the type of soil and the operating state, but as a general rule, the values in the following table are used.

To obtain only the productivity of a construction machine, the earth volume conversion factor is taken as Table 1 and machine productivity is expressed in terms of loose earth. However, when planning actual projects, work volume is calculated in terms of unexcavated earth or compacted earth, so care must be taken to convert these figures.

Example:

1,000 m³ of unexcavated earth has to be hauled.

- a) What will its volume be when it has been excavated ready for hauling?
- b) What will its volume be if it is then compacted?

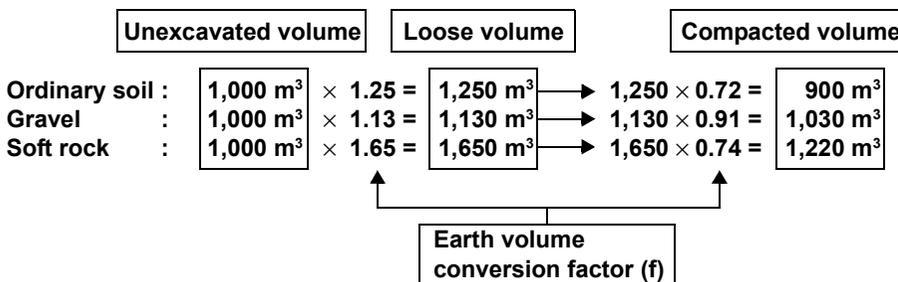

Table 1 Earth volume conversion factor (f)

Nature of earth	Initial	Conditions of earth to be moved		
		Bank condition	Loosened condition	Compacted condition
Sand	(A)	1.00	1.11	0.95
	(B)	0.90	1.00	0.86
	(C)	1.05	1.17	1.00
Sandy clay	(A)	1.00	1.25	0.90
	(B)	0.80	1.00	0.72
	(C)	1.11	1.39	1.00
Clay	(A)	1.00	1.43	0.90
	(B)	0.70	1.00	0.63
	(C)	1.11	1.59	1.00
Gravelly soil	(A)	1.00	1.18	1.08
	(B)	0.85	1.00	0.91
	(C)	0.93	1.09	1.00
Gravel	(A)	1.00	1.13	1.03
	(B)	0.88	1.00	0.91
	(C)	0.97	1.10	1.00
Solid or rugged gravel	(A)	1.00	1.42	1.29
	(B)	0.70	1.00	0.91
	(C)	0.77	1.10	1.00
Broken limestone, sandstone and other soft rocks	(A)	1.00	1.65	1.22
	(B)	0.61	1.00	0.74
	(C)	0.82	1.35	1.00
Broken granite, basalt and other hard rocks	(A)	1.00	1.70	1.31
	(B)	0.59	1.00	0.77
	(C)	0.76	1.30	1.00
Broken rocks	(A)	1.00	1.75	1.40
	(B)	0.57	1.00	0.80
	(C)	0.71	1.24	1.00
Blasted bulky rocks	(A)	1.00	1.80	1.30
	(B)	0.56	1.00	0.72
	(C)	0.77	1.38	1.00

(A) Bank condition (B) Loosened condition (C) Compacted condition

2. Job efficiency (E)

When planning a project, the hourly productivity of the machines needed in the project is the standard productivity under ideal conditions multiplied by a certain factor. This factor is called job efficiency.

Job efficiency depends on many factors such as topography, operator's skill, and proper selection and disposition of machines. Time out of an hour machine use is actually used.

It is very difficult to estimate a value for job efficiency due to the many factors involved. Therefore, efficiency is given in the following section as a rough guide.

BULLDOZERS**(DOZING)**

The hourly production of a bulldozer when excavating or dozing can be obtained by using the following formula:

$$Q = q \times \frac{60}{C_m} \times e \times E$$

where **Q** : Hourly production (m³/hr; yd³/hr) **q** : Production per cycle (m³; yd³)
C_m : Cycle time (in minutes) **e** : Grade factor
E : Job efficiency

1. Production per cycle (q)

For dozing operations, the production per cycle is theoretically calculated as follows:

$$q = q_1 \times a \quad q_1 : \text{Blade capacity (m}^3; \text{yd}^3) \quad a : \text{Blade fill factor}$$

When calculating the standard productivity of a bulldozer, the figure used for the volume of earth hauled in each cycle, was taken as blade capacity. In fact, production per cycle differs with the type of soil, so the blade fill factor is used to adjust this figure. See Table 2 to select the factor.

Table 2 Blade Fill Factor (a)

Dozing conditions		Blade fill factor (a)
Easy dozing	Full blade of soil can be dozed as completely loosened soil. Low water content, no-compacted sandy soil, general soil, stockpile material.	1.1 ~ 0.9
Average dozing	Soil is loose, but impossible to doze full blade of soil. Soil with gravel, sand, fine crushed rock.	0.9 ~ 0.7
Rather difficult dozing	High water content and sticky clay, sand with cobbles, hard dry clay and natural ground.	0.7 ~ 0.6
Difficult dozing	Blasted rock, or large pieces of rock	0.6 ~ 0.4

2. Cycle time (C_m)

The time needed for a bulldozer to complete one cycle (dozing, reversing and gear shifting) is calculated by the following formula:

$$C_m (\text{min.}) = \frac{D}{F} + \frac{D}{R} + Z$$

where **D** : Haul distance (m; yd) **F** : Forward speed (m/min.; yd./min.)
R : Reverse speed (m/min.; yd./min.) **Z** : Time required for gear shifting (min.)

(1) Forward speed/reverse speed

As a rule a speed range of 3-5 km/h for forward, and 5-7 km/h for reverse should be chosen.

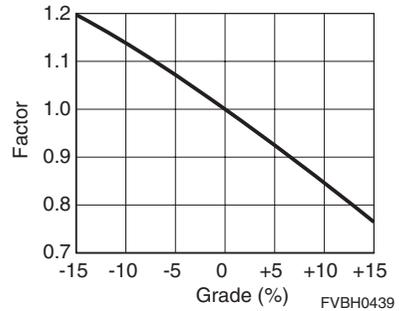

(2) Time required for gear shifting

	Time required for gear shifting
Direct-drive type	0.10 min.
TORQFLOW (Torque converter type)	0.05 min.

3. Grade factor (e)

Production is affected by the grade of the ground when dozing.

The grade factor can be selected in the right hand side graph.

4. Job efficiency (E)

The following table gives typical job efficiency as a rough guide. To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions. Time out of an hour machine use is actually used.

Operating conditions	Job efficiency
Good	0.83
Average	0.75
Rather poor	0.67
Poor	0.58

(RIPPING)

Ripping production varies greatly according to such conditions as the properties of the rock, the method of operation, and the operator's skill. Therefore, it is difficult to estimate. However, from available data, the relationship as shown on the ripper section can be seen between seismic velocity and production.

(RIPPING AND DOZING)

In normal ripping operations, ripping and dozing operations are carried out repeatedly in turn. The combined production for ripping and dozing operations is calculated using the following formula.

$$Q = \frac{QR \times QD}{QR + QD}$$

Where Q = Ripping and dozing production (m³/hr ; yd³/hr)

QR = Ripping production (m³/hr ; yd³/hr)

QD = Dozing production (m³/hr ; yd³/hr)

When making the calculation, it is necessary to use the same unit (natural rock position, loose rock condition, soil condition) for production QR and QD.

DOZER SHOVELS AND WHEEL LOADERS

(LOADING)

Generally, the hourly production can be obtained by using the following formula:

$$Q = q \times \frac{60}{Cm} \times E$$

where **Q** : Hourly production (m³ /hr; yd³ /hr) **q** : Production per cycle (m³; cu.yd³)
Cm : Cycle time (min.) **E** : Job efficiency

1. Production per cycle (q)

$$q = q_1 \times K$$

Where **q₁** : The heaped capacity given in the specifications sheet

K : Bucket fill factor The actual volume in the bucket differs depending on the type of loading material.
Bucket fill factor is used for that reason.

(1) Bucket fill factor

Table 3 Bucket fill factor

Loading condition	Wheel loader	Dozer shovel
A: Easy loading	1.0 ~ 1.1	1.0 ~ 1.1
B: Average loading	0.85 ~ 0.95	0.95 ~ 1.0
C: Rather difficult loading	0.8 ~ 0.85	0.9 ~ 0.95
D: Difficult loading	0.75 ~ 0.8	0.85 ~ 0.9

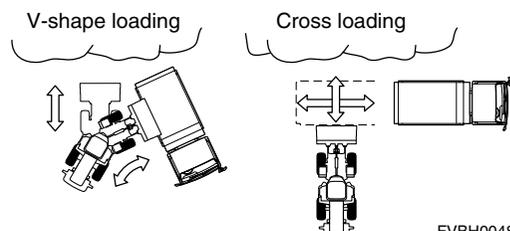

Table 4 Loading conditions

Operation conditions		Remarks
Easy loading (A)	Loading from a stockpile or from rock excavated by another excavator, bucket can be filled without any need for digging power. Sand, sandy soil, with good water content conditions.	<ul style="list-style-type: none"> Loading sand or crushed rock products Soil gathering such as loading of soil dozed by a bulldozer.
Average loading (B)	Loading of loose stockpiled soil more difficult to load than category A but possible to load an almost full bucket. Sand, sandy soil, clayey soil, clay, unscreened gravel, compacted gravel, etc. Or digging and loading of soft soil directly in natural ground condition.	Digging and loading of sandy natural ground.
Rather difficult loading (C)	Difficult to load a full bucket. Small crushed rock piled by another machine. Finely crushed rock, hard clay, sand mixed with gravel, sandy soil, clayey soil and clay with poor water content conditions.	Loading of small crushed rock
Difficult loading (D)	Difficult to load bucket, large irregular shaped rocks forming big air pockets. Rocks blasted with explosives, boulders, sand mixed with boulders, sandy soil, clayey soil, clay, etc.	Loading of blasted rock

2. Cycle time (Cm)

The following tables show the standard cycle time according to loading method and operating conditions.

It is possible to shorten a cycle time still more than the standard cycle time by minimizing moving distance.

FVBH0048

(1) V-shape loading

Table 5 Average cycle time for wheel loader

Unit: min.

Loading conditions		Bucket size		
		~ 3 m ³	3.1 ~ 5 m ³	5.1 m ³ ~
A	Easy	0.45	0.55	0.65
B	Average	0.55	0.65	0.70
C	Rather difficult	0.70	0.70	0.75
D	Difficult	0.75	0.75	0.80

Table 6 Average cycle time for dozer shovel

Unit: min.

Loading conditions		Bucket size	
		~ 3 m ³	3.1 ~ 5 m ³
A	Easy	0.55	0.60
B	Average	0.60	0.70
C	Rather difficult	0.75	0.75
D	Difficult	0.80	0.80

(2) Cross loading

Table 7 Average cycle time for wheel loader

Unit: min.

Loading conditions		Bucket size		
		~ 3 m ³	3.1 ~ 5 m ³	5.1 m ³ ~
A	Easy	0.40	0.50	0.60
B	Average	0.50	0.60	0.65
C	Rather difficult	0.65	0.65	0.70
D	Difficult	0.70	0.75	0.75

Table 8 Average cycle time for dozer shovel

Unit: min.

Loading conditions		Bucket size	
		~ 3 m ³	3.1 ~ 5 m ³
A	Easy	0.55	0.60
B	Average	0.60	0.70
C	Rather difficult	0.75	0.75
D	Difficult	0.80	0.80

3. Job efficiency (E)

The following table gives typical job efficiency as a rough guide. To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions.

Operating conditions	Job efficiency
Good	0.83
Average	0.80
Rather poor	0.75
Poor	0.70

(LOAD AND CARRY)

$$Q = q \times \frac{60}{C_m} \times E$$

where **Q** : Hourly production (m³/hr; yd³/hr) **q** : Production per cycle (m³; yd³)
C_m : Cycle time (min.) **E** : Job efficiency

1. Production per cycle (q)

$$q = q_1 \times K$$

where **q₁** : The heaped capacity given in the specifications sheet
K : Bucket fill factor

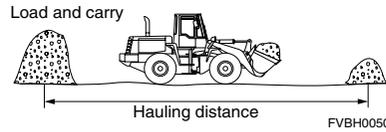

(1) Bucket fill factor

In a load and carry operation, fully heaped bucket causes soil spillage from bucket during hauling, so partially heaped bucket is recommendable.

Use a bucket fill factor of 0.7 ~ 0.9.

2. Cycle time (Cm)

$$Cm = \frac{D}{\frac{1000VF}{60}} + \frac{D}{\frac{1000VR}{60}} + Z$$

Where **D** : Hauling distance (m, yd)
VR: Return speed (km/hr; MPH)

VF : Travel speed with load (km/hr; MPH)
Z : Fixed time (min)

(1) Travel speed for wheel loader

Operation conditions		Speed km/hr(MPH)	
		Loaded	Empty
Good	Hauling on well compacted flat road, few bumps in road surface, no meeting other machines, can concentrate on L & C.	10 ~ 23 (6.2 ~ 14)	11 ~ 24 (6.8 ~ 15)
Average	Few bumps on road surface, flat road, some auxiliary work carrying large lumps of rock.	10 ~ 18 (6.2 ~ 11)	11 ~ 19 (6.8 ~ 12)
Rather poor	Bumps in road surface, high rate of auxiliary work.	10 ~ 15 (6.2 ~ 9.3)	10 ~ 16 (6.2 ~ 10)
Poor	Large bumps in road, meeting other machines, difficult to carry out smooth work, large amount of auxiliary work.	9 ~ 12 (5.6 ~ 7.5)	9 ~ 14 (5.6 ~ 8.7)

(2) Fixed time (Z)

$$Z = t_1 + t_2 + t_3 + t_4$$

where **Z** : 0.60 ~ 0.75 (min.)

t₂ : Turning time (0.15 min.)

t₁ : Loading time (0.20 ~ 0.35 min.)

t₃ : Dumping time (0.10 min.)

3. Job efficiency (E)

The following table gives typical job efficiency as a rough guide. To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions.

Operating conditions	Job efficiency
Good	0.83
Average	0.80
Rather poor	0.75
Poor	0.70

HYDRAULIC EXCAVATORS**(CONSTRUCTION APPLICATION)**

$$Q = q \times \frac{3600}{C_m} \times E$$

where **Q** : Hourly production (m³ /hr; yd³ /hr) **q** : Production per cycle (m³; yd³)
C_m : Cycle time (sec.) **E** : Job efficiency

1. Production per cycle (q)

$$q = q_1 \times K$$

where **q₁** : Bucket capacity (heaped) (m³; yd³) **K** : Bucket fill factor

(1) Bucket fill factor

The bucket fill factor varies according to the nature of material.

A suitable factor can be selected from the table, taking into consideration the applicable excavating conditions.

Table 9 Bucket fill factor (Backhoe)

~ PC2000	Excavating Conditions	Bucket fill factor
Easy	Excavating natural ground of clayey soil, clay, or soft soil	1.1 ~ 1.2
Average	Excavating natural ground of soil such as sandy soil and dry soil	1.0 ~ 1.1
Rather difficult	Excavating natural ground of sandy soil with gravel	0.8 ~ 0.9
Difficult	Loading blasted rock	0.7 ~ 0.8

Table 10 Bucket fill factor (Loading shovel)

~ PC2000	Excavating Conditions	Bucket fill factor
Easy	Loading clayey soil, clay, or soft soil	1.0 ~ 1.1
Average	Loading loose soil with small diameter gravel	0.95 ~ 1.0
Rather difficult	Loading well blasted rock	0.90 ~ 0.95
Difficult	Loading poorly blasted rock	0.85 ~ 0.90

2. Cycle time (Cm)

Cycle time = Excavating time + swing time (loaded) + dumping time + swing time (empty)

However, here we use **cycle time = (standard cycle time) × (conversion factor)**

The standard cycle time for each machine is determined from the following table.

Table 11 Standard cycle time for backhoe

Unit: sec

Model	Range	Swing angle		Model	Range	Swing angle	
		45° ~ 90°	90° ~ 180°			45° ~ 90°	90° ~ 180°
PC78		10 ~ 13	13 ~ 16	PC270, PC290		15 ~ 18	18 ~ 21
PW140		11 ~ 14	14 ~ 17	PC300, PC350		15 ~ 18	18 ~ 21
PC130		11 ~ 14	14 ~ 17	PC400, PC450		16 ~ 19	19 ~ 22
PC160		13 ~ 16	16 ~ 19	PC600		17 ~ 20	20 ~ 23
PW160, PW180		13 ~ 16	16 ~ 19	PC750, PC800, PC850		18 ~ 21	21 ~ 24
PC180		13 ~ 16	16 ~ 19	PC1250		22 ~ 25	25 ~ 28
PC200, PC210		13 ~ 16	16 ~ 19	PC2000		24 ~ 27	27 ~ 30
PW200, 220		14 ~ 17	17 ~ 20				
PC220, PC230, PC240		14 ~ 17	17 ~ 20				

Table 12 Standard cycle time for loading shovel

Model	sec
PC400	16 ~ 20
PC600, PC750, PC800	18 ~ 22
PC1250	20 ~ 24
PC2000	27 ~ 31

Table 13 Conversion factor for excavator

Digging condition ($\frac{\text{Digging depth}}{\text{Specified max. digging depth}}$)	Dumping condition			
	Easy (Dump onto spoil pile)	Normal (Large dump target)	Rather difficult (Small dump target)	Difficult (Small dump target requiring maximum dumping reach)
Below 40%	0.7	0.9	1.1	1.4
40 ~ 75%	0.8	1	1.3	1.6
Over 75%	0.9	1.1	1.5	1.8

3. Job efficiency (E)

The following table gives typical job efficiency as a rough guide. To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions.

Operating conditions	Job efficiency
Good	0.83
Average	0.75
Rather poor	0.67
Poor	0.58

(MINING APPLICATION)

The production for Mining Shovels should be calculated on loaded trucks per hour

Hourly production = loaded truck per hour x truck capacity x time utilisation

$$Qh = Tn \times Tq \times E$$

Theoretical loaded trucks per hour = $3600 \text{ sec} / (\text{Loading time per truck} + \text{spotting time per truck})$

$$Tn = 3600 / (tT + tsp)$$

Loading time per truck = $(\text{truck size} / \text{bucket capacity}) \text{ rounded} \times \text{cycle time}$

$$tT = (Tq / (Bc \times K \times \text{loose density})) \text{ rounded} \times tc$$

Gh = hourly production (ton/hr; US ton/hr)

Tn = number of loaded trucks per hour

Tq = truck capacity (ton; US ton)

E = time utilisation per hour (%)

tT = truck loading time (sec)

tsp = truck spotting time (sec)

Bc = bucket capacity (m³; cu.yd)

K = bucket fill factor (%)

tc = cycle time (sec)

Yearly production = $(\text{hours per year} - \text{service hours}) \times \text{availability} \times \text{mine efficiency}$

$$QY = Qh \times (hy - hs) \times Sa \times M$$

QY = yearly production

hy = theoretical hours per year (hr)

hs = service hour per year (hr)

Sa = mining shovel availability (%)

M = mine efficiency (%)

1. Cycle time (tc)

The following tables give a rough guide line for estimating a production.

Attention:

- 1) Cycle times are average figures and for diggable material only
- 2) With skilled operator only
- 3) Every 10 degrees more swing will increase the cycle time by 1 second
- 4) Cycle times for standard attachments only
- 5) Following cycle times are without commitment, due to different job side conditions

(1) Backhoe

Model	Digging conditions			Backhoe application
	Easy	Average	Severe	
PC3000	23 ~ 25	26 ~ 28	29 ~ 31	<ul style="list-style-type: none"> • Truck on lower level • Average swing 45°
PC4000	23 ~ 26	27 ~ 29	30 ~ 32	
PC5500	24 ~ 27	28 ~ 30	31 ~ 33	
PC8000	25 ~ 28	29 ~ 31	32 ~ 34	

Model	Digging conditions			Backhoe application
	Easy	Average	Severe	
PC3000	32 ~ 35	36 ~ 38	39 ~ 41	<ul style="list-style-type: none"> • Truck on upper level • Average swing 120° • Optimized working depth 4-5 m (13'1"-16'5")

PC5500	34 ~ 37	38 ~ 40	41 ~ 43	
PC8000	35 ~ 38	39 ~ 41	42 ~ 44	

Model	Digging conditions			Backhoe application
	Easy	Average	Severe	
PC3000	26 ~ 29	30 ~ 32	33 ~ 35	<ul style="list-style-type: none"> • Split bench application • Average swing 90°-120°
PC4000	27 ~ 30	31 ~ 33	34 ~ 36	
PC5500	28 ~ 31	32 ~ 34	35 ~ 37	
PC8000	29 ~ 32	33 ~ 35	36 ~ 38	

(2) Front shovel

Model	Digging conditions			Front shovel application
	Easy	Average	Severe	
PC3000	24 ~ 26	27 ~ 29	30 ~ 32	<ul style="list-style-type: none"> • Truck on same level • Average swing 60°
PC4000	24 ~ 27	28 ~ 30	31 ~ 33	
PC5500	25 ~ 28	29 ~ 31	32 ~ 34	
PC8000	26 ~ 29	30 ~ 32	33 ~ 35	

2. Time utilisation per hour (E)

The following table gives typical time utilisation as a rough guide. To obtain the actual production figure, determine the value in accordance with actual operating conditions.

Operating conditions	Time utilisation
Good	0.83
Average	0.75
Rather poor	0.67
Poor	0.58

3. Bucket fill factor (K)

The bucket fill factor varies according to the nature of material.

A suitable factor can be selected from the table, taking into consideration the applicable excavating conditions.

Bucket fill factor (Backhoe)

PC2000 ~ PC8000	Excavating Conditions	Bucket fill factor
Easy	Excavating natural ground of clayey soil, clay, or soft soil	1.0
Average	Excavating natural ground of soil such as sandy soil and dry soil	0.95
Severe	Excavating natural ground of sandy soil with gravel Loading blasted rock	0.9

Bucket fill factor (Front shovel)

PC2000 ~ PC8000	Excavating Conditions	Bucket fill factor
Easy	Loading clayey soil, clay, or soft soil	1.0
Average	Loading loose soil with small diameter gravel	0.95
Severe	Loading well blasted rock Loading poorly blasted rock	0.9

DUMP TRUCKS

When carrying out operations using a suitable number of dump trucks of suitable capacity to match the loader, the operating efficiency is calculated in the following order:

1. Estimating the cycle time

The cycle time of a dump truck consists of the following factors.

- (1) Time required for loader to fill dump truck
- (2) Hauling time
- (3) Time required for unloading (dumping) plus time expended for standby until unloading is started.
- (4) Time required for returning
- (5) Time required for dump truck to be positioned for loading and for the loader to start loading

Accordingly, the cycle time = (1) + (2) + (3) + (4) + (5)

The cycle time is calculated as follows:

Cycle time of dump truck (Cmt)

$$Cmt = n \times Cms + \frac{D}{V_1} + t_1 + \frac{D}{V_2} + t_2$$

(1) (2) (3) (4) (5)

- (1) : Loading time
- (2) : Hauling time
- (3) : Dumping time
- (4) : Returning time
- (5) : Spot and delay time

Where, n: Number of cycles required for loader to fill dump truck

$$n = C_1 / (q_1 \times K)$$

C₁ : Rated capacity of dump truck (m³, yd³)

q₁ : Bucket capacity of loader (m³, yd³)

K : Bucket fill factor of loader

Cms: Cycle time of loader (min)

D: Hauling distance of dump truck (m, yd)

V₁: Average speed of loaded truck (m/min, yd/min)

V₂: Average speed of empty truck (m/min, yd/min)

t₁: Time required for dumping + time required for standby until dumping is started (min)

t₂: Time required for truck to be positioned and for loader to start loading (min)

1) Loading time

The time required for a loader to load a dump truck is obtained by the following calculation.

Loading time = Cycle time (Cms) × No. of cycles to fill dump truck (n)

a) Cycle time of loader (Cms)

The cycle time of a loader is dependent on the type of loader (excavator, crawler type loader, wheel loader, etc.)

For the cycle time of loaders, refer to the section pertaining to the estimation of the production of loaders.

b) Number of cycles required for loader to fill dump truck full (n)

The payload of a dump truck depends on its capacity or weight.

Where the payload is determined by the capacity, $n = \frac{\text{Rated capacity (m}^3, \text{yd}^3\text{) of dump truck}}{\text{Bucket capacity (m}^3, \text{yd}^3\text{)} \times \text{bucket fill factor}}$

Where the payload is determined by the weight, $n = \frac{\text{Rated capacity (m}^3, \text{yd}^3\text{) of dump truck}}{\text{Bucket capacity (m}^3, \text{yd}^3\text{)} \times \text{bucket fill factor} \times \text{specific weight}}$

- * The bucket capacity and the body capacity, as a general rule, refer to heaped capacity but may be used to refer to struck capacity depending on the nature of materials to be handled.
- * The bucket fill factor is determined by the nature of soil to be excavated or loaded. In case of dozer shovels or wheel loaders, a suitable factor can be selected from among those given in Table 3, 9, 10 according to the applicable loading condition.

2) Material hauling time and returning time

The time taken to haul a load and return empty, can be calculated by dividing the haul road into sections according to the rolling resistance and grade resistance, as follows.

a) Rolling resistance and grade resistance

As described above, the haul road is divided into several sections according to the rolling resistance and grade resistance. All of these rolling resistance and grade resistance values are summed up, resulting in the totals for each resistance.

The rolling resistance for the haul road conditions can be selected by referring to Table 14. The grade resistance can be obtained by averaging the gradients in all sections, which is converted (from degrees to percent). Table 15 indicates the grade resistance values (%) converted from the angles of gradients.

Table 14 Rolling resistance

Haul road conditions	Rolling resistance
Well-maintained road, surface is flat and firm, properly wetted, and does not sink under weight of vehicle	2%
Same road conditions as above, but surface sinks slightly under weight of vehicle	3.5%
Poorly maintained, not wetted, sinks under weight of vehicle	5.0%
Badly maintained, road base not compacted or stabilized, forms ruts easily	8.0%
Loose sand or gravel road	10.0%
Not maintained at all, soft, muddy, deeply rutted	15 to 20%

Table 15 Grade resistance (%) converted from angle (°) of gradient

Angle	% (sin α)	Angle	% (sin α)	Angle	% (sin α)
1	1.8	11	19.0	21	35.8
2	3.5	12	20.8	22	37.5
3	5.2	13	22.5	23	39.1
4	7.0	14	24.2	24	40.2
5	8.7	15	25.9	25	42.3
6	10.5	16	27.6	26	43.8
7	12.2	17	29.2	27	45.4
8	13.9	18	30.9	28	47.0
9	15.6	19	32.6	29	48.5

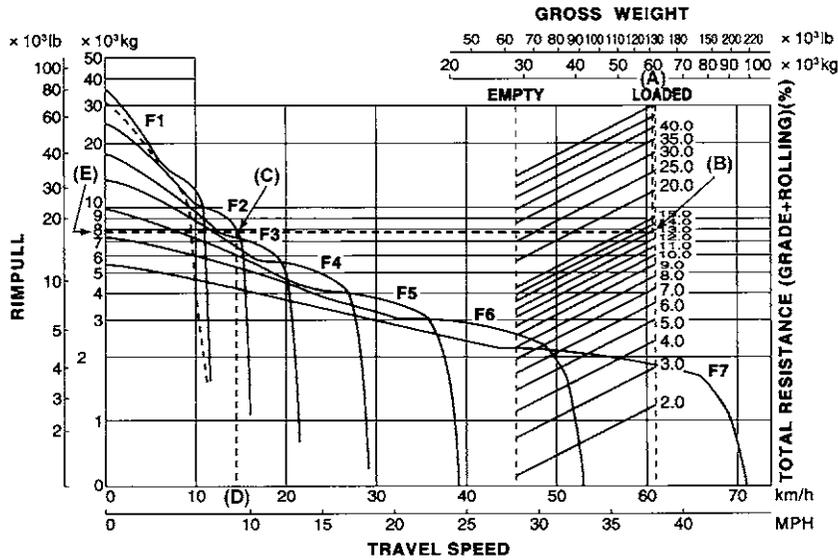

b) Selection of the travel speed

The speed range suited to the resistance, and the maximum speed, can be obtained by using the Travel Performance Curve appears in the spec sheet.

To use, first draw a vertical line according to the vehicle's weight (A) and mark the point (B) corresponding to total resistance (the sum of rolling resistance and grade resistance).

Next, draw a horizontal line from (B), then mark (C) where the line intersects the rimpull curve and read (E) for the rimpull. For travel speed (D), draw a vertical line downward from (C). For instance, when traveling a 8% gradient and encountering a 5 % rolling resistance, a vehicle with a maximum payload should have a rimpull of 8 tons (8.8 ton) and travel at a speed of 15.0 km/h (9.3 MPH) in forward 2nd gear.

Fig. 1 KOMATSU HD325 Dump Truck Travel Performance Curve

The maximum speed thus obtained is a theoretical value, and in order to convert this maximum speed to a practicable average speed, the speed should be multiplied by a speed factor. An applicable speed factor can be selected from the following table.

How to select a speed factor

If a truck is to start off downhill, gear shifting to a desired speed can be accomplished in a short time. In such a case, a rather higher value should be used in each range of factors. On the other hand, if a truck is to start off on a level road or uphill, it will take a comparatively long time for gear-shifting to a desired speed to be accomplished and thus, the lower factor value should be selected in an applicable range of factors.

Table 16 Speed factors

Distance of each section of haul road, m	When making a standing start	When running into each section
0 - 100	0.25 - 0.50	0.50 - 0.70
100 - 250	0.35 - 0.60	0.60 - 0.75
250 - 500	0.50 - 0.65	0.70 - 0.80
500 - 750	0.60 - 0.70	0.75 - 0.80
750 - 1000	0.65 - 0.75	0.80 - 0.85
1000 -	0.70 - 0.85	0.80 - 0.90

Thus, the average speed can be obtained in the following manner:

The average speed =
Maximum vehicle speed obtained from the travel performance curve × (Speed factor)

The above average speed is applicable in ordinary driving conditions. If there is any factor retarding the vehicle speed, an applicable factor should be used.

The following can be cited as factors retarding a vehicle speed.

- Vehicles passing each other on a narrow road
- Sharp curve or many curves in the road
- Points giving poor visibility
- Narrow bridges or at railway crossings, intersections of roads
- Extreme differences in rolling resistance
- Pot-holes on the road
- Un-experienced or unskilled operators

These factors should be eliminated wherever possible.

c) Hauling time

If the hauling distance in each section is divided by the average speed given in the preceding paragraph, the hauling time in each section will be obtained. If all of these times (for hauling and returning) are added together, they will give the total hauling and returning time.

Hauling time and returning time in each section

$$= \frac{\text{Length of section (m)}}{\text{Average speed (m/min.)}}$$

d) Vehicle speed limitation for a downhill run

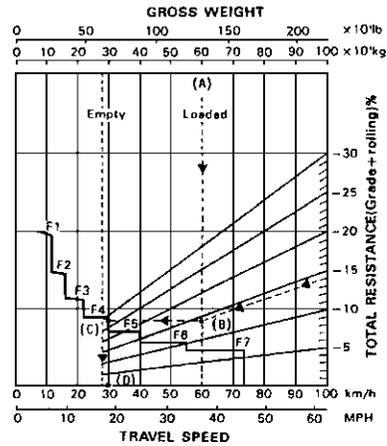

Calculation of a vehicle speed as described in Paragraphs a) to c) is effected with the total resistance in 0 or in a plus value. If the total resistance is a minus value, the vehicle speed will ordinarily be limited by the retarder function with a given distance.

In the case of the HD325 dump truck, the maximum speed at which the truck can safely go down a hill can be obtained in the brake performance curve in Fig. 2. (Grade distance continuous).

For example, assume the total resistance is -14% (gradient resistance is -16% plus rolling resistance +2%) on the "continuous grade" graph. First, draw a vertical line from the total vehicle weight(A) so that it crosses the slanted line of 14% total resistance(B). From(B), draw a horizontal line to the left and it will cross the stair curve at (C).

Finally, draw a vertical line from(C) and read(D) the maximum speed for driving safely down the slope. In this case, a vehicle with a 32-ton payload should travel at approximately 30 km/h (18.6 MPH) in forward 4th gear.

Fig. 2 HD325 Brake Performance (Grade distance continuous)

3) Dumping time

This is the period from the time when the dump truck enters the dumping area, to the time when the dump truck starts its return journey after completing the dumping operation. The length of the dumping time depends on the operating conditions, but average dumping times for favorable average and unfavorable conditions are given by the following table.

However, particularly adverse conditions giving rise to extremely long dumping times are excluded.

Operating conditions	t ₁ , min.
Favorable	0.5 to 0.7
Average	1.0 to 1.3
Unfavorable	1.5 to 2.0

4) Time required for the truck to be positioned and for the loader to begin loading.

The time taken for the truck to be positioned and for the loader to begin loading also depends on the operating conditions. As a general rule, a suitable time can be selected from the table at right.

Operating conditions	t ₂ , (min.)
Favorable	0.1 to 0.2
Average	0.25 to 0.35
Unfavorable	0.4 to 0.5

As has so far been described, the cycle time of a dump truck can be estimated by using the values for factors obtained according to paragraph 1) to 4).

2. Estimating the number of dump trucks required (M)

The quantity of dump trucks required for use in combination with a loader working at its maximum operating efficiency can be estimated by the following formula:

$$M = \frac{\text{Cycle time of a dump truck}}{\text{Loading time}} = \frac{Cmt}{n \times Cms}$$

Where, n : Number of cycles required for a loader to fill a dump truck
 Cms : Cycle time of loader (min)
 Cmt : Cycle time of dump truck (min)

3. Estimating the productivity of dump trucks

The total hourly production P of several dump trucks where they are doing the same job simultaneously is estimated by the following formula:

$$P = C \times \frac{60}{Cmt} \times E_t \times M$$

Where, P : Hourly production (m³/h; yd³/hr)
 E_t : Job efficiency of dump truck
 M : Q'ty of dump trucks in operation
 C : Production per cycle C = n × q₁ × K
 Where, n : Number of cycles required for loader to fill dump truck
 q₁ : Bucket capacity of loader (m³, yd³)
 K : Bucket fill factor of loader
 Cmt : Cycle time of dump truck

Table 16 gives typical job efficiency as a rough guide.

To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions.

Table 16 Job efficiency of dump truck (E_t)

Operating conditions	Job efficiency
Good	0.83
Average	0.80
Rather poor	0.75
Poor	0.70

4. Combined use of dump trucks and loaders

When dump trucks and loaders are used in combination, it is most desirable that the operating capacity of the dump trucks be equal to that to the loaders. That is, conditions satisfying the following equation are most desirable. Consequently, if the value of the left equation is larger, the group of dump trucks has a surplus capacity. On the other hand, if the value of the right equation is larger, the group of loaders has a surplus capacity.

$$C \times \frac{60}{Cmt} \times E_t \times M \geq q_1 \times K \times \frac{60}{Cms} \times E_s$$

Where, Cms : Cycle time of a loader (min) E_s : Job efficiency of loader
 q₁ : Bucket capacity (heaped (m³; yd³)) K : Bucket fill factor

The left equation has already been described. The right equation has the following meaning.

EXAMPLE

• A HD325, working in combination with a WA600, is hauling excavated material to a spoil-bank 500 meters away.
What is the hauling capacity of the HD325?

Working conditions for dump truck:

Haul distance: flat road: 450 m
 slope: 50 m
 gradient of slope: 10%

Speed limits:
 For safety purposes, the following maximum speeds should not be exceeded.

Haul road condition:
 Road with sunken surface, not wetted, poorly maintained.

Type of soil:
 Sandy clay (loose density 1.6 tons/ m³)

Job efficiency:
 0.83 (good operating conditions)

		Speed
Flat	Loaded	40 km/h
	Unloaded	60 km/h
Uphill	Loaded	20 km/h
	Unloaded	40 km/h
Downhill	Loaded	20 km/h
	Unloaded	40 km/h

Wheel Loader: Bucket capacity : 5.4m³ (7.1cu.yd)
 Cycle time : 0.65 min
 Bucket fill factor : 0.9
 Job efficiency : 0.83

Answer

(a) Cycle time (Cmt)

(i) Loading time

Cycle time of loader Cms = 0.65 min
 Number of cycles required for loader to fill dump truck

$$n = \frac{\text{Rated capacity of dump truck}}{\text{Bucket capacity} \times \text{bucket fill factor} \times \text{loose density}} = \frac{32 \text{ tons (max. payload)}}{5.4 \text{ m}^3 \times 0.9 \times 1.6} = 4.12$$

n is taken to be 4.

Loading time = n × Cms = 4 × 0.65 = 2.60 min.

(ii) Hauling time and returning time

The hauling distance is divided up and the time taken to cover each section should be calculated.

Hauling:	1 Flat	330 m	Returning:	4 Flat	120 m
	2 Uphill	50 m		5 Downhill	50 m
	3 Flat	120 m		6 Flat	330 m

Net weight of dump truck (unloaded): 27,200 kg (figure in specifications)

Loaded weight :

$$\begin{aligned} \text{Weight when loaded} &= n \times \text{bucket capacity} \times \text{bucket fill factor} \times \text{loose specific gravity} \times 1,000 \\ &= 4 \times 5.4 \text{ m}^3 \times 0.9 \times 1.6 \times 1,000 = 31,104 \text{ kg} \end{aligned}$$

$$\text{Weight of loaded dump truck} = 27,200 \text{ kg} + 31,104 \text{ kg} = 58,304 \text{ kg}$$

Using the Travel Performance Curve and Brake Performance Curve, the maximum speed for each section can be calculated.

The values for HD325 can be calculated from PERFORMANCE CURVE on the section 7A.

The result is shown in the table below and the table of Hauling time and Returning time is 3.00 min.

Calculation of Hauling time and Returning time

		Dis- tance	Grade Resis- tance	Rolling Resis- tance	Total Resis- tance	Speed Range	Max. Travel Speed	Speed Factor	Ave. Speed	Time Taken
Hauling (Loaded)	Flat	330	0	5%	5%	F5	36 km/h (600 m/min)	0.50	300.0 m/min	1.10 min
	Uphill	50	10 %	5%	15%	F2	11 km/h (183 m/min)	0.60	109.8 m/min	0.46
	Flat	120	0	5%	5%	F5	36 km/h (600 m/min)	0.60	300.0 m/min	0.40
Returning (Unloaded)	Flat	120	0	5%	5%	F6	53 km/h (883 m/min)	0.35	309.1 m/min	0.39
	Down- hill	50	-10 %	5%	-5%	F6	*40 km/h (667 m/min)	0.70	466.9 m/min	0.11
	Flat	330	0	5%	5%	F6	53 km/h (883 m/min)	0.70	618.1 m/min	0.54
Total										3.00 min

*: In the Brake Performance Curve (Fig. 2), the figure for total resistance is given as -5%. This means that when driving unloaded and using the speed range F6 as shown in the diagram, it is enough to press the accelerator pedal and keep within the speed limit.

(iii) Dumping time and standby time

$$t_1 = 1.15 \text{ min. (average)}$$

(iv) Time required for the dump truck to be positioned for loading, and for the loader to start loading

$$t_2 = 0.3 \text{ min. (average)}$$

(v) Cycle time

$$Cmt = 2.60 + 3.00 + 1.15 + 0.3 = 7.05 \text{ min.}$$

(b) Estimating the production of dump truck

$$P = C \times \frac{60}{Cmt} \times Et = 19.44 \times \frac{60}{7.05} \times 0.83 = 137.3 \text{ m}^3/\text{h}$$

$$C = n \times \text{bucket capacity} \times \text{bucket fill factor} = 4 \times 5.4 \times 0.9 = 19.44 \text{ m}^3$$

MOTOR GRADERS

The motor grader is used for many purposes such as maintaining roads, final finishing for earthmoving projects, trenching and bank cutting.

Therefore there are many methods of expressing its operating capacity.

1. Calculating the hourly operating area (m²/h)

$$Q_A = V \times (L_e - L_o) \times 1000 \times E$$

Where **Q_A** : Hourly operating area (m²/hr) **V** : Working speed (km/hr)
L_e : Effective blade length (m) **L_o** : Width of overlap (m)
E : Job efficiency

NOTE: Graders usually operate on long stretches, so the time required for gear shifting or turning can be ignored.

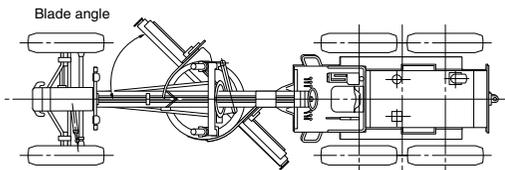

1) Working speed (V)

- Road repair : 2 to 6 km/h
- Bank finishing: 1.6 to 2.6km/h
- Field grading : 1.6 to 4 km/h
- Trenching : 1.6 to 4 km/h
- Snow-removal: 7 to 25 km/h
- Leveling : 2 to 8 km/h

2) Effective blade length (Le), width of overlap (Lo)

Since the blade is normally angled when cutting or grading the surface, the effective blade length depends on the angle.

The width of overlap is usually 0.3 m. Following table gives the values to be used when applying the formula.

Blade length (m)	Effective blade length (m)	
	Blade angle 60°	Blade angle 45°
2.2	1.9	1.6
2.5	2.2	1.8
2.8	2.4	2.0
3.05	2.6	2.2
3.1	2.7	2.2
3.4	2.9	2.4
3.7	3.2	2.6
4.0	3.5	2.8
4.3	3.7	3.0
4.9	4.2	3.5

3) Job efficiency (E)

The following table gives typical job efficiency as a rough guide. To obtain the actual production figure, determine the efficiency in accordance with actual operating conditions.

Operating conditions	Job efficiency
Road repair, leveling	0.8
Snow-removal (V-type plow)	0.7
Spreading, grading	0.6
Trenching, snow-removal	0.5

2. When calculating the time required to finish a specific area.

$$T = \frac{N \times D}{V \times E}$$

Where **T** = Working time (h) **N** = Number of trips
D = Working distance (km) **V** = Working speed (km/hr)
E = Job efficiency

Number of trips (N)

When a grader is operating in a job site, and leveling parallel strips, the number of trips can be calculated by using the following formula:

$$N = \frac{W}{Le - Lo} \times n$$

Where W : Total width to be leveled (m) Le : Effective blade length (m)
 Lo : Width of overlap (m)
 n : Number of grading required to finish the surface to the required flatness.

SOIL COMPACTORS

There are two ways of expressing the productivity of compactors: by the volume of soil compacted, and by the area compacted.

1. Expressing productivity by the volume of soil compacted.

When calculating the productivity by the volume of soil compacted, the following formula is used.

$$Q = \frac{W \times V \times H \times 1000 \times E}{N}$$

Where

Q = Hourly production (m³/hr)(volume of soil compacted)
V = Operating speed (km/hr)
W = Effective compaction width per pass (m)
H = Compacted thickness for one layer (m)
N = Number of compaction (number of passes by compactor)
E = Job efficiency

1) Operating speed (V)

As a general rule the following values are used.

Road roller	about 2.0 km/hr
Tire roller	about 2.5 km/hr
Vibration roller	about 1.5 km/hr
Soil compactor	4 - 10 km/hr
Tamper	about 1.0 km/hr

2) Effective compaction width (W)

Type of Equipment	W
Macadam roller	Driving wheel width - 0.2 m
Tandem roller	Driving wheel width - 0.2 m
Soil compactor	(Driving wheel width × 2) - 0.2 m
Tire roller	Outside-to-outside distance of most outside tires - 0.3 m
Large vibratory roller	Roller width - 0.2 m
Small vibratory roller	Roller width - 0.1 m
Bulldozer	(Width of track shoe × 2) - 0.3 m

3) Compacted thickness for one layer (H)

Compacted thickness is determined from compaction specifications or from the results of tests, but as a general rule, it is 0.2 ~ 0.5 m in loosened soil.

Number of trips (N)

When a grader is operating in a job site, and leveling parallel strips, the number of trips can be calculated by using the following formula:

$$N = \frac{W}{Le - Lo} \times n$$

Where W : Total width to be leveled (m) Le : Effective blade length (m)
 Lo : Width of overlap (m)
 n : Number of grading required to finish the surface to the required flatness.

SOIL CLASSIFICATION FOR EARTH-MOVING OPERATIONS

Various classifications have been established properly for soil depending on the purposes of earth-moving operations. Generally speaking, however, detailed classifications of soil are not required for the ordinary earth-moving operations.

Rather, attention is required to be given to whether the soil to be handled is of special ores or contains special clay minerals.

Hereinafter is described the knowledge necessary for earth work planning prior to such operations as digging, loading, hauling, pushing (spreading), rolling compaction, etc., on ordinary terrain.

- * Data (figures) to be given hereinafter vary largely depending on various operating and environmental conditions. Consequently, before starting the earth work, tests should be conducted to obtain correct data for operations.

Some knowledge of the weight data per unit volume of materials of their major ingredients is important for their handling or hauling in mines, etc.. The specific weight data of some major types of soil and ingredients are given below.

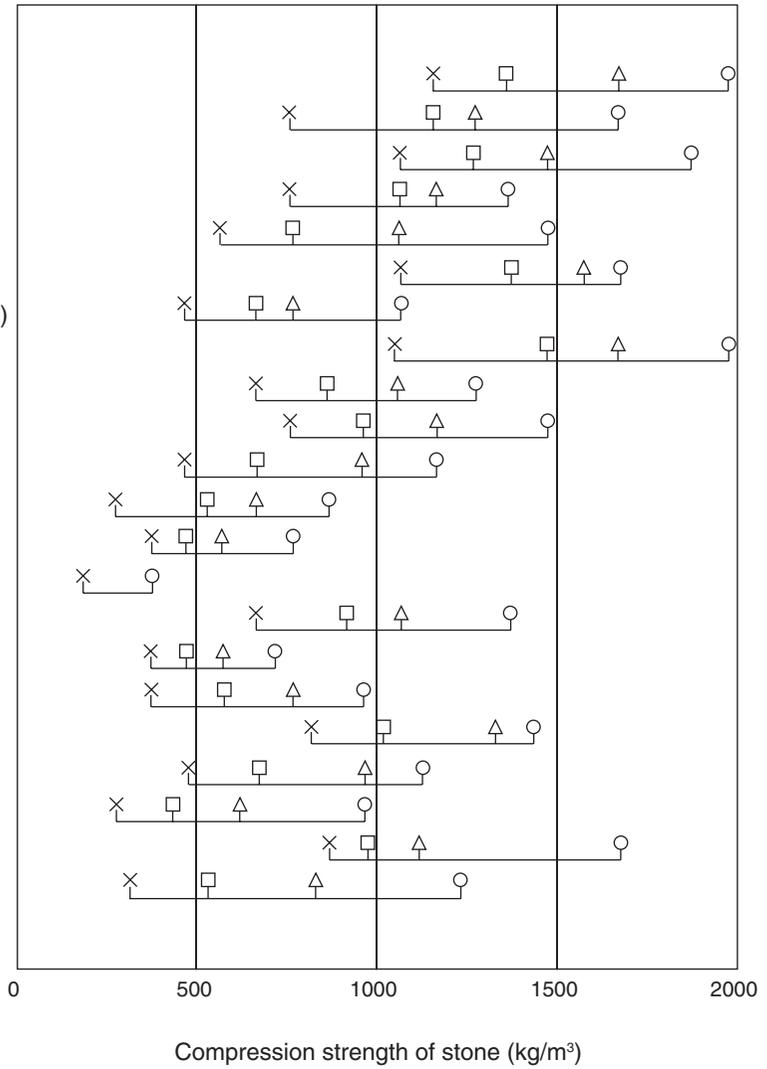

WEIGHT DATA OF MATERIALS

Material		Specific Gravity (ton/m ³)	
		Bank	Crushed (Loose)
Basalt		2.95	1.7
Bauxite		1.9	1.42
Caliche		2.26	1.25
Carnotite, uranium ore		2.2	1.63
Cinders		0.86	0.56
Clay		1.8	1.45
Clay & gravel		2.0	1.45
Coal	Anthracite	1.3	1.0
	Bituminous	0.59 ~ 0.89	0.53 ~ 0.65
Decomposed Rock - 75% Rock, 25% Earth 50% Rock, 50% Earth 25% Rock, 75% Earth		2.0	1.75
		2.1	1.75
		2.2	1.65
Earth - Dry Wet Loam		1.8	1.4
		2.0	1.6
		1.54	1.25
Granite		2.8	1.6
Gravel		2.17	1.93
Gypsum		3.17	1.81
Hematite, iron ore		3.5	2.0
Limestone		2.8	1.6
Magnetite, iron ore		5.05	2.9
Peat	Dry	0.60 ~ 0.70	0.40 ~ 0.50
	Wet	1.80 ~ 2.00	1.10 ~ 1.20
Pyrite, iron ore		3.03	2.85
Sand - Dry Dump Wet		1.6	1.42
		1.9	1.69
		2.08	1.84
Sand & clay	Loose	2.02	1.6
	Compacted	—	2.4
Sand & gravel	Dry	1.93	1.72
	Wet	2.23	2.02
Sandstone		2.7	1.55
Slag		2.94	1.75
Snow	Dry	—	0.13
	Wet	—	0.52
Stone		2.67	1.6
Taconite		2.36 ~ 2.7	1.63 ~ 1.9
Top soil		1.37	0.95
Trap rock		2.50 ~ 2.70	1.60 ~ 1.80

HAULING PERFORMANCE OF CONSTRUCTION MACHINES

INTRODUCTION

"What Model or type of a tractor is most suitable to pull this trailer?" "Is this bulldozer capable of going up this hill while pulling that scraper loaded full?"

In order to give explicit answers to these questions, it is necessary to have the right understanding of the hauling performance of vehicles.

For easy understanding, let us explain the hauling performance with the following machine capabilities and related elements.

- (1) The inherent machine capability
- (2) Elements limiting the inherent machine capability
- (3) Machine capabilities required for earthmoving operations

INHERENT MACHINE CAPABILITY

1. What is the inherent machine capability?

a) Output power

The engine horsepower of a construction machine is the most essential power of those developed by the machine itself. This can be estimated by multiplying one element (traction force) by another element (a travel speed). Accordingly, where the engine of a machine develops a rated power; the smaller the travel speed, the larger the traction force or drawbar pull will be. On the contrary, the larger the travel speed, the smaller the drawbar pull.

b) Gear-shifting

Gear-shifting is effected to determine the optimum drawbar pull and travel speed required for accomplishing a given job. Therefore, a machine has several gears to be selected by shifting for the optimum travel speed.

2. Direct-drive type tractor

The table below gives the drawbar pull and travel speeds of a direct-drive type bulldozer.

Gear-shifting	Travel speed km/h	Rated drawbar pull kg	Max. drawbar pull kg
F1	2.5	27600	34500
F2	3.5	19700	—
F3	4.9	14100	—
F4	6.4	10780	—
F5	8.9	7670	—
F6	12.9	5350	—

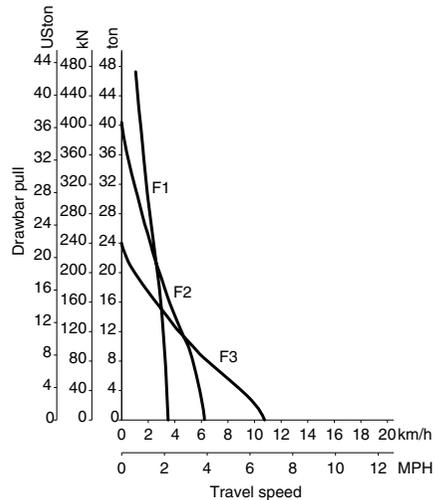

The rated drawbar pull is such a traction force that can be developed at the rated engine power and the rated revolutions (rpm). The rated drawbar pull is normally estimated by taking into account the travelling resistance (which will be explained later) and the mechanical loss of power in its line from the engine to the sprockets.

The maximum drawbar pull is the maximum traction force that can be developed by a machine and is estimated from the maximum engine torque. In other words, the maximum drawbar pull of a machine can be developed by the lugging ability of its prime mover and is practically obtained in a low gear. Consequently, the maximum drawbar pull is shown only at F1 on the specifications.

3. TORQFLOW-drive type tractor

In a TORQFLOW-drive type tractor, the relationships between the travel speeds and drawbar pull are obtained from the combined performance between the engine and the torque converter.

In a TORQFLOW-drive machine, it is difficult to relate both the drawbar pull and travel speeds directly to the engine revolutions. Thus, the hauling performance is indicated by curves. The graph at right gives the hauling performance curves of the TORQFLOW-drive type bulldozer.

ELEMENTS LIMITING THE INHERENT MACHINE CAPABILITY

1. What are the elements limiting the inherent machine capability or power? These are;

- a) Traction between the undercarriage (tracks or wheels) and the road surface.
- b) Altitude

Altitude in b) will be described in a separate issue and herein is examined the problem of traction between the undercarriage and the road surface.

2. Traction between the undercarriage and road surface

"When a motor vehicle cannot be moved due to slipping on the snow-covered road, what should be done to move the vehicle?"

The answers are;

- | <u>Solution</u> | <u>Reason</u> |
|---|---|
| (1) Add load to the driving wheels. | ⇒ The traction force is increased with the added load. |
| (2) Install chain to the wheel tires or replace the tires with the spiked type. | ⇒ The undercarriage is made so as to develop more traction. |
| (3) Scatter sand or spread straw mats on the road surface. | ⇒ The critical traction force is increased by the higher coefficient of traction. |

The above facts can also be applied to a crawler tractor. Now, let us look at the coefficient of cohesion and the critical traction force or traction used in the above table.

The critical traction is the maximum traction available depending on the cohesive condition of the road surface. This can be estimated by the following formula.

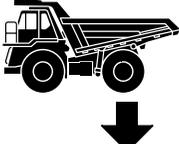

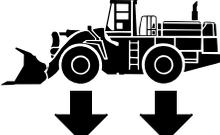

$$F_d = \mu d \cdot G_d$$

Where, F_d : Critical traction (kg)
 μd : Coefficient of traction
 G_d : Weight imposed on the driving wheels (kg)

The coefficient of traction depends on the condition of the road surface. Any applicable coefficient of traction can be selected from among those given in the table below.

	Tractor w/pneumatic tires	Crawler tractor
Dry concrete	0.95	0.45
Dry macadam road	0.70	
Wet macadam road	0.65	
Dry unpaved plain road	0.60	0.90
Dry ground	0.55	0.90
Wet ground	0.45	0.85
Dry loose terrain	0.40	0.60
Loose gravel	0.36	0.25
Loose sand	0.27	0.30
Muddy ground	0.25	0.25
Packed snow	0.20	0.15
Ice	0.12	0.12

Weight to be imposed on the driving wheels can be determined by referring to the table below

Crawler type tractor	2-wheel drive machine	4-wheel drive machine
		
Total weight of tractor	Weight imposed on the driving wheels	Total weight of tractor

Example (1) Assume that the D155 tractor pulling a towed compactor must do compaction in a dry, loose terrain. What is the critical drawbar pull?

Solution: The operating weight of the D155 tractor is 26730 kg. Then, $F_d = 0.60 \times 26730 = 16040$ kg

Example (2) What are the values of the drawbar pull which the D50A-15 bulldozer can develop at F1 and F2 in a dry, loose terrain?

Solution: The operating weight of the D50A-15 bulldozer is 11400 kg. Its critical drawbar pull is $11400 \times 0.60 = 6840$ kg.
 The rated drawbar pull indicated in its specifications is 8280 kg at F1 or 5920 kg at F2.

Consequently

at F1: The rated drawbar pull is 8280kg, but the tracks will start shoe slip at the drawbar pull beyond 6840kg, making it impossible for its drawbar pull to be utilized to the full. Thus, the critical drawbar pull practically available is 6840 kg.

at F2: The rated drawbar pull is 5920kg. Thus, the drawbar pull can be utilized to the full.

MACHINE CAPABILITIES REQUIRED FOR EARTHMOVING OPERATIONS

1. What are the elements limiting the machine capabilities required for earthmoving operations?

When a truck is traveling on the road or going uphill, the following phenomena will be encountered as a matter of course.

<u>Phenomenon</u>	<u>Influential element</u>
(1) The travel speed of a truck with load on the flat road should vary when the same truck with the same load travels on the rugged or rutted surface.	⇒ Rolling resistance
(2) When traveling on the flat road or going uphill in the same operating gear, the travel speed should vary as a matter of course.	⇒ Grade resistance

2. Rolling resistance

When a vehicle is traveling on the ground or road, the retarding force of ground against wheels or tracks should take place. Such a resistance varies depending on the ground or road surface conditions.

The rolling resistance is measured in the ratio to the vehicle weight and can be estimated by the following formula.

$$W_r = \mu_r \cdot G$$

Where, W_r : Rolling resistance (kg) μ_r : Coefficients of rolling resistance
 G : Vehicle operating weight

The coefficient of rolling resistance can be selected from among those given in the table below, according to the ground or road surface conditions.

The coefficient of rolling resistance can be selected from among those given in the table below, according to the ground or road surface conditions.

Type and conditions of ground	μ_r (%)		
	Vehicle w/iron wheel treads	Crawler tractor	Tractor w/pneumatic tires wheels
Iron truck	1.0		
Concrete floor	2.0	2.8	2.3
Macadam road	2.9	3.3	2.8
Wood pavement	2.5		
Dry unpaved plain road	4.5	4.6	3.5
Firm terrain	10.0	5.5	4.0
Dry, loose terrain	11.5	6.5	4.5
Soft terrain	16.0	8.0	9.0
Loose gravel	15.0	9.0	12.0
Loose sand	15.0	9.0	12.0
Muddy ground		12.0	16.0
Packed snow			3.7
Ice			2.0

In a crawler tractor, too, the rolling resistance should vary depending on the type of applied soil. The representative values of rolling resistance, however, are taken into account in preparing the curves for drawbar pull and hauling performance of crawler tractors. Therefore, the varying rolling resistance may practically be ignored.

Example (3) What is the rolling resistance of the D85-12 tractor to pull the RS12 scraper (empty). The ground surface is in a soft terrain.

Solution: The weight of an RS12 scraper (empty) is 10500 kg
The rolling resistance = $0.09 \times 10500 = 945\text{kg}$

Example (4) What is the rolling resistance of the D155 tractor to pull the RS24 scraper loaded full. The ground surface is in a dry loose terrain.

Solution: The net weight of an RS24 is 18000 kg
The maximum payload is 34080 kg
The gross weight is 52080 kg
Thus, the rolling resistance = $0.045 \times 52080 = 2340\text{ kg}$

3. Grade resistance

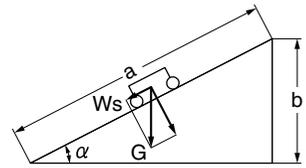

The grade resistance is the retarding force of gravity to be encountered when a vehicle is going uphill. The grade resistance can be estimated by the following formula.

$$W_s = G \cdot \sin \alpha$$

Where, W_s : Grade resistance (kg)

G : Operating weight of a vehicle (kg)

α : Angle formed with the horizon (degree)

FVBH0041

A grade (degree) and $\sin \alpha$ can be selected from among those given in the table below.

Grade resistance (%) converted from angle (°) of gradient

Grade resistance (%) converted from angle (°) of gradient

Angle	% (sin α)	Angle	% (sin α)	Angle	% (sin α)
1	1.8	11	19.0	21	35.8
2	3.5	12	20.8	22	37.5
3	5.2	13	22.5	23	39.1
4	7.0	14	24.2	24	40.2
5	8.7	15	25.9	25	42.3
6	10.5	16	27.6	26	43.8
7	12.2	17	29.2	27	45.4
8	13.9	18	30.9	28	47.0
9	15.6	19	32.6	29	48.5
10	17.4	20	34.2	30	50.0

Example (5) What is the grade resistance against the D50A-15 angledozer going uphill at 15° ?

Solution: The operating weight of the D50A-15 angledozer is 11400 kg. Thus, the grade resistance will be $11400 \times 0.259 = 2950\text{ kg}$

4. Hauling resistance

The hauling resistance is the grand total of the rolling resistance, grade resistance, accelerating resistance and air resistance. However, construction machines are slow in the travel speed. Normally, the hauling resistance of construction machines may be considered to be the total of the rolling resistance and grade resistance.

The grade resistance acts so as to retard the uphill traveling of a vehicle, whereas the grade resistance acts so as to accelerate the downhill traveling. The above relationships can be indicated as follows:

Conditions

Uphill traveling
Traveling on flat, level surface
Downhill traveling

Haul resistance

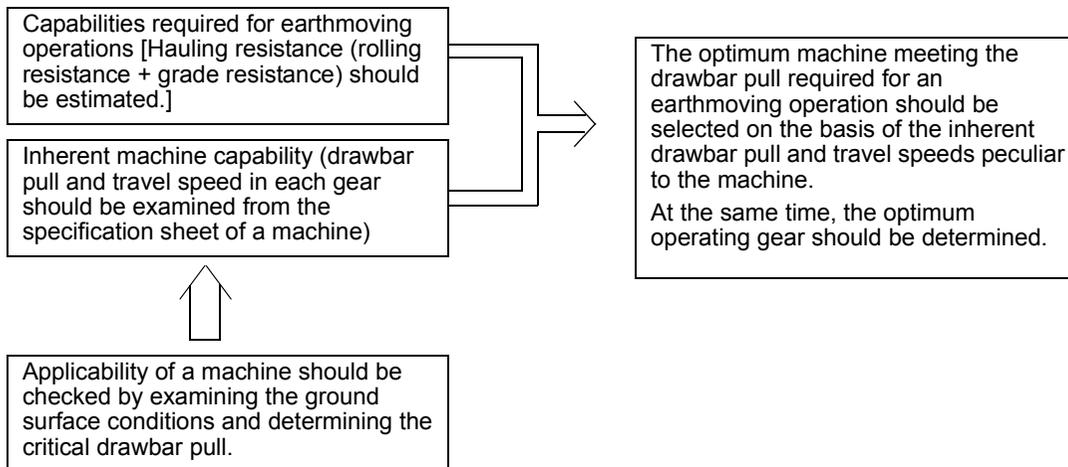

Rolling resistance + grade resistance
Rolling resistance.
Rolling resistance – grade resistance

Example (6) What is the hauling resistance against the D60-6 tractor going uphill at 4° in a dry, loose terrain, while pulling an RS08 scraper with maximum load?

Solution: The gross weight of the RS08 with maximum load is 18870 kg.
The rolling resistance factor is 0.045. Thus, the rolling resistance is $0.045 \times 18870 = 850$ kg
The weight of the D60-6 tractor is 12550 kg.
The gross weight of the RS08 is 18870 kg.
Then, the total weight of both machines is 31420 kg
Consequently, the grade resistance is $0.07 \times 31420 = 2200$ kg.
Thus, the hauling resistance is $850 + 2200 = 3050$ kg.

SUMMARY AND APPLICATION

1. Summary

2. Application

Example (7) Assume that the D65 tractor is used to pull a wheeled wagon (the empty weight: 17 tons) with a 50-ton load in a dry, loose terrain.
What are the operating gears and the corresponding approx. travel speeds available on a flat, level ground? What is the degree of a hill climbable under the same condition?

Solution: The rolling resistance

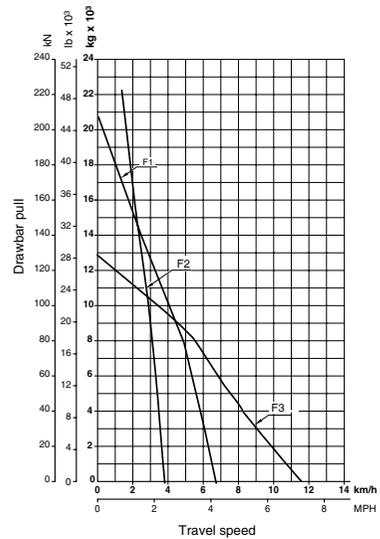

Weight of the wagon (empty): 17000 kg Payload: 50000 kg
Total weight: 67000 kg Coefficient of rolling resistance: 0.045
Consequently the rolling resistance against the wagon is $67000 \times 0.045 = 3015$ kg

Operating gears and travel speeds on flat, level ground

From the hauling performance curves below, the operating gears and travel speeds at a 3015 kg drawbar pull are:

approx. 9.0 km/h at F3 or

approx. 6.0 km/h at F2

Critical drawbar pull

The operating weight of D65 tractor: 12750 kg

Coefficient of traction: 0.60

Consequently, the critical drawbar pull is $12750 \times 0.60 = 7650$ kg

Degree of a climbable hill (gradeability)

Tractor weight + wagon weight + pay load = $12750 + 17000 + 50000 = 79750$ kg

The grade resistance retarding per angle of grade is $79750 \times 0.018 = 1435$ kg

Consequently,

$$\text{Gradeability} \left(\frac{\text{Critical drawbar pull} - \text{rolling resistance}}{\text{Grade resistance per angle of grade}} \right) \text{ will be } \frac{7650 - 3015}{1435} = 3.2 \text{ (degree)}$$

The explanations made so far on the travelling or hauling performance of construction machines pertain only to the traveling of individual machines and the pulling of towed vehicles by tractors. For instance where a tractor pulls a scraper, it can be judged whether the tractor can be used for this purpose, but it can not be determined whether the tractor can perform a digging or a loading operation under the same conditions as mentioned above. Operators or field-superintendents are requested to keep it in mind that such a judgement should be based on the operators' accumulated experiment or on the reference for such operating combinations or cooperation among towing tractors and towed vehicles as recommended by KOMATSU.

TRAFFICABILITY

Operating efficiency of a construction machine depends largely on the ground surface on which the machine travels. In clay, loam or clayey soil high in water or moisture content, the bearing force of soil is low and a "kneading" phenomenon is liable to occur. Consequently, there are cases where a construction machine cannot be operated because of the type and conditions of soil. The degree of the traveling capability of a construction machine is called the traffic-ability.

In general, traffic-ability is indicated by a cone index No. (The method of measuring a cone index No. will be described later.)

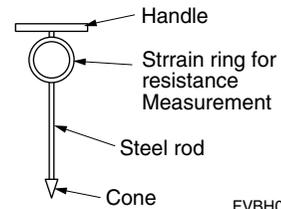

The larger the cone index number becomes, the higher the traffic-ability of the machine will become. In other words, on the soil larger in cone index No., a construction machine will be able to travel easier.

The minimum cone index numbers required for various types of construction machines to perform digging, hauling operations, etc. are given below.

Cone index No.	Type of construction machine	Ground pressure (kg/cm ²)
Below 2	Ultra swamp bulldozer (PL class)	0.15 ~ 0.25
2 to 4	Swamp bulldozer (P Class)	0.2 ~ 0.3
4 to 5	Small-size bulldozer (D20 ~ D31)	0.3 ~ 0.6
5 to 7	Medium-size bulldozer (D41~D75S)	0.6 ~ 0.8
7 to 10	Large-size bulldozer (D85 ~ D575) & towed scraper	0.7 ~ 1.5
10 to 13	Motor scraper	
15 & more	Dump truck	

NOTE:

In determining a cone index, apply the cone penetrometer at 3 or 4 points at least to average the variations in the measured values.

FVBH0042

* Cone index numbers (qc)

A cone index number is measured by means of a cone penetrometer in a cone penetration test.

A rod with a cone at the tip is pushed into the soil by hand.

The pressure required to advance the cone at a slow constant rate is known as the penetration resistance.

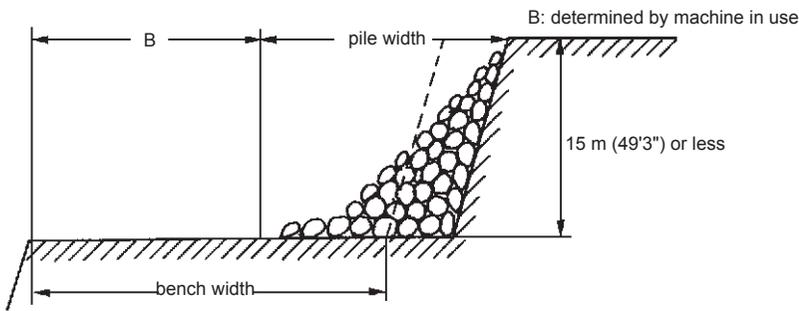

The penetration resistance is read out on the dial gauge.

Thereby, the shearing strength of soil can be estimated.

Then, a cone index number can be obtained by referring the estimated shearing strength to the conversion table attached to the meter.

1. Blasting and bench width

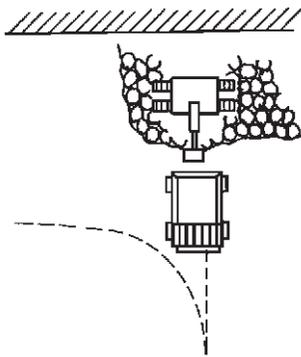

Minimum bench width should be at least twice the cutting face height.

2. Machine and bench width

2.1 Excavator loading to the dump truck

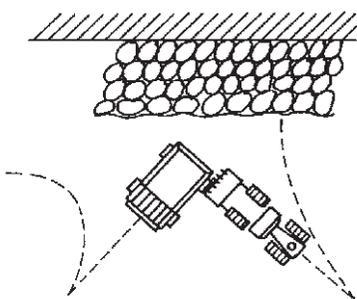

Bench width must be at least three times the dump truck's turning radius.

Model	Min. turning radius m (ft.in)	Bench width m (ft.in)
HD255	7 (23')	21 (68'11")
HD325	7.2 (23'7")	22 (72'2")
HD405	7.2 (23'7")	22 (72'2")
HD465	8.5 (27'11")	27 (88'7")
HD605	8.5 (27'11")	27 (88'7")
HD785	9.9 (32'6")	30 (98'5")
HD1500	12.2 (40')	36 (118'1")
730E	14.0 (45'11")	42 (137'10")
830E	14.2 (46'7")	43 (141'1")
930E	12.36 (40'7")	37 (121'5")

2.2 Wheel loader loading to the dump truck

Bench width must be at least three times the wheeled loader's length.

Model	Wheel loader length m (ft.in)	Bench width m (ft.in)
WA500	9.4 (30'10")	29 (95'2")
WA600	11.0 (36'1")	33 (108'3")
WA700	12.5 (41')	38 (124'8")
WA800	13.7 (44'11")	42 (137'10")
WA900	14.3 (46'11")	42 (137'10")
WA1200	18.2 (59'9")	55 (180'5")

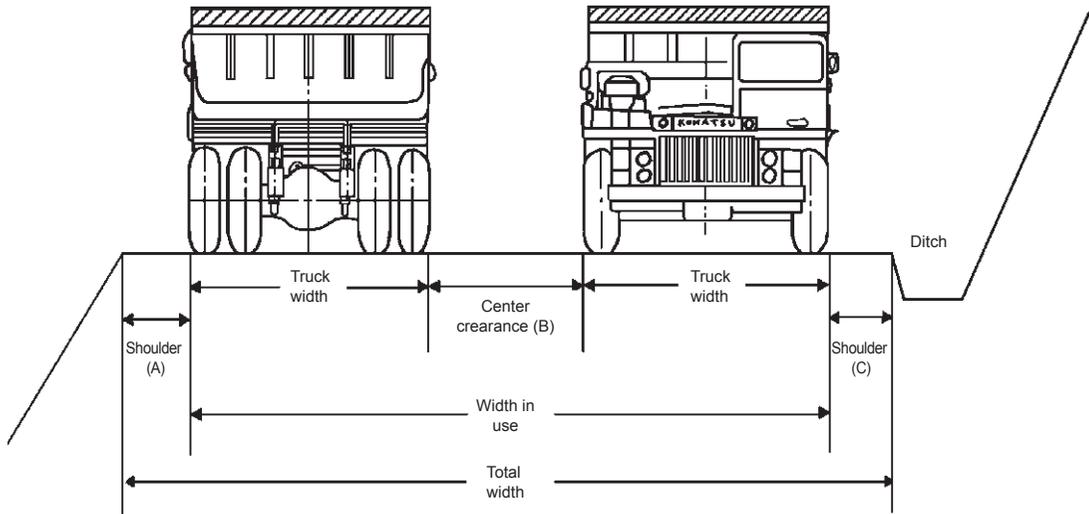

3. Haul road planning

3.1 Dump truck width and haul road size

The width dump truck haul road must have sufficient room to accommodate the model of dump truck planned for use on the site.

In order to accommodate one lane in each direction, with trucks going 30 km/h (18.6 MPH), the haul road must be at least four times the truck width

Dump truck width and haul road size

Model	Speed km/h (MPH)	Center clearance (B) m (ft.in)	Downhill shoulder (A) m (ft.in)	Uphill shoulder (C) m (ft.in)	Total road width m (ft.in)

ESTIMATION OF THE OWNING & OPERATING COSTS

Along with the trend for mechanization adopted for economical and satisfactory job accomplishment, equipment costs now occupy a large proportion of the overall construction cost. Therefore, the estimation of the equipment costs has become more important. Success or failure in a contract for a construction job is virtually dependent on the estimates of the equipment costs. In other words, careful consideration of the equipment costs is of prime importance, if a contractor is to fulfill the contract at a profit. Unless estimates are made properly, there will occur cases where a construction job cannot be accomplished at a profit.

There are two types of equipment costs: owning costs and operating costs. Owning costs refer to the costs incurred even if the machine is not working. They include depreciation, interest, taxes and insurance. Operating costs are the costs incurred in actually operating the machine. They include costs for repair, fuel, lubricants, tires, special items (consumable parts such as ground engaging tool) and operator's wages.

We would like to explain **one method** of estimating the owning and operating costs of construction equipment in this handbook.

The owning and operating costs of construction equipment can vary widely because they are influenced by many factors: the type of work the machine does, local prices of material, labor, fuel and lubricants, interest rates, etc. Accordingly it is very dangerous to estimate the costs relying entirely on an established form of calculation method.

In this Manual, however, we will make approximate estimates of general application of the equipment costs. Accordingly, if users want more accurate values of the costs, we hope that they will make estimates by taking into account their own reference data and territorial or environmental conditions.

Depreciation period, and repair and periodic maintenance cost are especially affected by specific application and type of work. Therefore, if you need those data, we suggest that you contact the local Komatsu distributor with necessary information.

The equipment owning and operating costs are calculated in units of \$/m³, \$/m² or \$/h, etc., depending on the type of construction work. The costs in \$/m³ or \$/m² are obtained by dividing the cost in \$/h by production (m³/h) and thus, it is recommended that the owning and operating costs be calculated in the unit of \$/h as generally accepted.

1. OWNING COST

The equipment owning cost is the expense required, as a matter of course, for the purchase and possession of the equipment as a property of its owner and consists of the following two items.

- (1) Depreciation**
- (2) Interest, insurance and taxes**

1-1. DEPRECIATION

In general, depreciation is a tax term referring to the legally permitted decline in value from the original purchase price of equipment, and is an assessable property (expressed in units of years). Depreciation referred to herein is a business practice for conserving the investment in the form of purchased equipment, in other words, for making preparations in a systematic manner for the fund necessary for replacing the existing equipment with new or any other equipment.

$$\text{Depreciation} = \frac{\text{Net Depreciation Value}}{\text{Depreciation Period in Hours}}$$

Net depreciation value means Original purchase price minus Resale or Trade-in price.

The depreciation period varies considerably according to the equipment operating conditions. It is also affected by the speed of fund collection desired by the user, environmental and economic conditions in its applied territory. Furthermore, it goes without saying that maintenance of equipment is a significant

factor in determining the economical life of the equipment. Proper maintenance will extend the life of equipment. On the other hand, poor or improper maintenance will shorten the life. There is the legal depreciation period in each country for tax purpose. However, in the business, it is rather usual to employ the equipment owning period as the depreciation period. The equipment owning period is strongly affected by the economical life of the equipment (Years or hours for which the equipment can be used gainfully).

When you need to estimate the value of the economical life for a specific product, please consult your distributor or Komatsu representative. They can suggest you with the appropriate values from their experience and the data they have. (The former handbook contained the depreciation period, but they are removed because the straight numbers sometimes mislead the readers.)

The net depreciation value is the net amount to be considered in the depreciation of equipment.

In case of crawler-type tractors, their purchase prices are used to calculate the net depreciation value. In wheel type equipment, their tire values should be deducted from the purchase prices, because, unlike the undercarriages of crawler-type equipment, tires wear out earlier than the equipment chassis proper, and tires are not cheap. Further, there is a possibility of tires becoming unserviceable suddenly in unexpected accidents. Hence, it is necessary in tire depreciation to include their degrees of wear into the operating cost.

RESALE OR TRADE-IN VALUES

At the time of resale or trade-in, construction machines have a value.

Some users will hope that in terms of book value the machine will depreciate completely within the depreciation period. Other users will hope that the residual value expressed as resale value or trade-in value will be left. For these users the resale value or trade-in value is an important factor in reducing the capital invested. This value is also a factor when deciding to purchase a new machine.

The resale value or trade-in value changes greatly according to the territory. Therefore the conditions in that territory must be considered when determining these values. However, major factors in deciding resale value or trade-in value are the hours of operation, nature of work and working environment. The real resale value or trade-in value cannot be decided simply, but when a realistic value is decided it is subtracted from the purchase price to give the Net Depreciation value. It is then possible to obtain the depreciation from the Net Depreciation Value.

1-2.INTEREST, INSURANCE AND TAXES

Whether or not purchased equipment is actually in operation, its users must pay interest, insurance and taxes. Interest refers to the interest on the investment, when the investment is covered by the user's own fund or to the interest on the debt, when the investment is covered by a debt. In either case, the interest will be an equal amount.

Insurance and taxes are imposed on the annual residual values of the equipment, which requires knowledge of depreciation as prescribed by the tax law. The depreciation rate or the depreciation period (whether it is a fixed amount or a fixed rate) vary according to the country. For the correct values of insurance and taxes on the residual value in a country, the calculation formulas established in that country must be used.

Interest, insurance and taxes are imposed on the residual value that is the difference between the purchase price and the depreciated amount. This residual value decreases every year. However, when the user calculates owning & operating costs, it is convenient to consider interest, insurance and taxes as a constant amount paid out each year. For this reason, the machine will be considered here to depreciate by a constant annual amount. A calculation is made of the average value of the residual value at the beginning of each year within the depreciation period, and interest, insurance and taxes are imposed on this value. By dividing this value by the number of hours the user expects to operate the machine in one year, the hourly value can be calculated.

This can be calculated by using the following formula.

$$\text{Interest, insurance, tax} = \frac{\text{Factor} \times \text{Delivered price} \times \text{Annual rates}}{\text{Annual use in hours}}$$

The annual rates are the total of those of interest, insurance and tax.

The factor can be obtained by using Table 1 or can be calculated by the following formula.

$$\text{Factor} = 1 - \frac{(n - 1)(1 - r)}{2n}$$

where **n**: Depreciation period

$$r: \text{Trade-in value rate} = \frac{\text{Machine worth at trade-in or resale time}}{\text{Delivered price}}$$

(Example)

Delivered price: \$100,000

Annual rates: 15%

Annual use in hours: 2,000 hrs

Trade-in value: \$25,000

Depreciation period (n) : 4 years

Solution

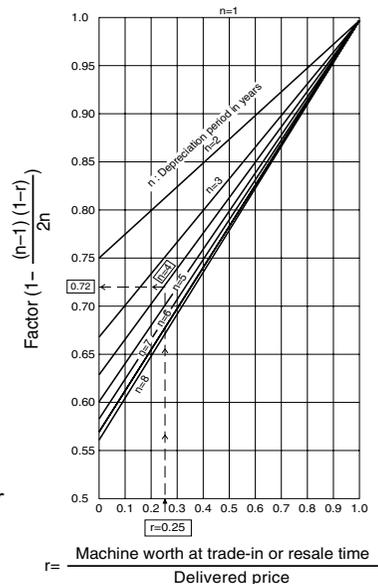

$$r = \frac{25,000}{100,000} = 0.25$$

$$\text{Factor} = 1 - \frac{(4 - 1)(1 - 0.25)}{2 \times 4} = 0.72$$

When obtaining the factor by using Table 1.
 Enter r = 0.25 in Table 1
 Move vertically to n = 4 line and horizontally to left axis.
 Applicable factor is 0.72

$$\text{Interest, insurance, tax} = \frac{0.72 \times \$100,000 \times 0.15}{2,000} = \$3.59$$

Table 1 Factor of Interest, Insurance, Taxes

2. OPERATING COST

The equipment operating costs are proportional to the time that the equipment works. Items considered in this category are as follows:

- (1) Fuel
- (2) Lubricants (oil and grease), Filters and Periodic Maintenance Labor
- (3) Tires
- (4) Repair Cost
- (5) Special items (Ground engaging tools)
- (6) Operator's wage

2-1. FUEL

More definite fuel consumption data should be measured in the field.

It is possible, however, to anticipate the actual or approximate consumption values according to the actual operating conditions without measuring the consumption. **Table 3** gives the hourly fuel consumption values for KOMATSU construction machines. In this table, the average values are given, provided that the job conditions are classified into three different ranges of application. If a user has data on certain operating conditions, more correct or realistic values will be obtained by applying these data in similar operating conditions, provided that the equipment is limited to the same type as that used in the user's data.

To estimate hourly fuel cost, select the job condition based on application and find hourly fuel consumption.

$$\text{Hourly fuel cost} = \text{Hourly fuel consumption} \times \text{Local unit price of fuel}$$

2-2. LUBRICANTS (OIL AND GREASE), FILTERS AND PERIODIC MAINTENANCE LABOR

It is possible to measure the consumption of lubricants and grease in the same manner as the fuel consumption. The consumption values of lubricants and grease are also obtained by calculation on the basis of lubrication intervals, but they are affected greatly by the type of machines and their operating conditions, which makes it difficult to specify the consumption suited for various machines and their operating conditions. **Table 4** gives the data based on the oil use per hour for your reference.

$$\text{Hourly Lubricant Consumption} = \text{Oil replacement amount (liter)} \div \text{Oil change interval (hour)}$$

Prices of lubricants vary in countries or areas and, therefore, the local price (price in that country or area) should be used.

In KOMATSU construction machines, filter replacement intervals are standardized for each machine model. Thus, the cost of filter can be calculated from the local price of filter and the replacement interval. The hourly filter cost is the total of the hourly costs for each type of filter.

(Example)

$$\text{Hourly cost of filter A} = \frac{\text{Number of filters A} \times \text{Local price of filter}}{A}$$

The same method is used for calculating the hourly filter cost of other filters. For quick estimation, hourly filter costs are about 50% of hourly lubricant costs. If they are used in the dusty terrain, the calculated value should be multiplied by a proper factor.

If necessary, we suggest you to contact the local Komatsu distributor with necessary information to get the assistance for estimating them.

2-3. TIRES

As has been described in Depreciation, tires are in the category of consumable parts and tires are generally expensive. Therefore, it is better to include the tire cost as an individual item in the operating costs. Tire cost is calculated by the following formula.

$$\text{Hourly tire cost} = \frac{\text{Tire price}}{\text{Estimated life}}$$

As tire prices vary in each country or area, the price of tires actually bought by a user should be applied. It is difficult to indicate definitely the tire life, because the tire life is affected by many factors. However, the general measurements for the life expectancy of tires can be indicated on the basis of past experience and data obtained from the tire manufacturers. Refer to **Table 4**.

In this table, the approximate life values are given for three different types of conditions. The optimum value for a certain ground condition is one of those obtained by a user in experience on similar ground conditions. When recapped tires are to be used, their prices and life expectancy must be changed correspondingly.

2-4. REPAIR COST

Components or parts of a machine will in due course wear and sometimes fail. To keep a machine in a properly maintained condition, these components or parts must be replaced. It is natural for the repair cost of a machine to start from a small amount and gradually increase with time as the machine is operated. The repair cost of a machine can be estimated actually as described above with respect to the machine operating time. However, in general, repair cost is considered as an average of total repair costs throughout the service life of a machine. In other words, it is based on the concept that part of repair cost to be paid later should be laid aside in advance.

Repair costs are more greatly affected by the machine operating conditions than by any other cost items. It depends greatly on the job, operating techniques or operator's skill, proper maintenance, etc. In a specific job application, calculation for repair cost should be made on the basis of the data accumulated in the past. If such data are not available, the calculation should be made with due consideration of experience.

Repair Cost are affected by specific application and type of work as well. Therefore, we suggest that you contact the local Komatsu distributor with necessary information for the repair cost estimation.

2-5. SPECIAL ITEMS (GROUND ENGAGING TOOLS)

In the objects of repair, the repair costs include the machine and its attachments. Some parts of a machine wear faster than others. These parts are the ground engaging tools and not included in the category of repair but in a group of special items. Life expectancy of ripper points, ripper shanks and shank protector is given in **Table 5**.

2-6. OPERATOR WAGES

Operator hourly wages vary according to the country and area. Thus, the wages actually paid by users should be used.

3. EXAMPLE OF CALCULATION

PC200 is delivered for \$92,811 at a job site.

Applications:

Mass excavation or trenching where machine digs all the time in natural bed clay soils. Some traveling and steady, full throttle operation.

Net Depreciation Value

Since the machine is a crawler-type, tires are not involved. This owner knows from experience that at trade-in time, the machine will be worth approximately 10% of its delivered price 4 years from now.

Trade-in value is \$9,281

Net depreciation value = \$92,811 – \$9,281 = \$83,530

OWNING COST

Depreciation:

Putting 10,000 hours as the example depreciation period.

$$\text{Depreciation} = \frac{\$83,530}{10,000} = \$8.35$$

Interest, Insurance, Taxes

Owner plans to use machine during 4 years and about 2,500 hours per year.

$$\text{Trade-in value rate}(r) = \frac{\$9,281}{\$92,811} = 0.1$$

Calculate the Factor according to depreciation period and trade-in value rate, which is 0.66.

Enter the annual rates of interest, insurance and taxes and total them, which is 0.14 as an example.

$$\text{Interest, insurance, taxes cost} = \frac{0.66 \times \$92,811 \times 0.14}{2,500} = \$3.43$$

Add up the depreciation cost and interest, insurance, taxes cost for total owning.

OPERATING COST

Fuel: See Table 3.

The intended application is in medium range. The estimated fuel consumption from table is 12.5 liter/hour.

Cost of fuel in this area is \$0.2/liter.

Consumption × Unit cost = 12.5 liter/hr × \$0.2/liter = \$2.5

Lubricants, Filters and Periodic Maintenance labor:

Use local Komatsu distributor's estimation. (For calculation example: use \$0.39)

Tires are not involved, since the machine is crawler type.

Repair Cost

Use local Komatsu distributor's estimation. (For calculation example: use \$3.30)

Repairs = \$3.30

Since the machine does not have fast wear parts like ripper points of bulldozer or cutting edge of motor grader, special item can be disregarded.

Operator hourly wage in this area is \$16.00.

Add up the fuel cost, lubricant grease filter costs, repair cost and operator's hourly wage for operating cost.

TOTAL HOURLY OWNING AND OPERATING COSTS

Add up the total owning cost and total operating cost.

Estimation of The Owning & Operating Costs

OWNING & OPERATING COSTS

EXAMPLE

Estimated Owning and Operating Costs :

Machine & Model :	Hydraulic Excavator PC200	
Attachments :	Standard bucket 0.8m ³ (SAE heaped)	
Delivered Price (including attachments) :	_____	\$ 92,811
Less Tire Price :		
Front :	_____	
Rear :	_____	
Total Tire Price :	_____	
Delivered Price Less Tire :	_____	
Trade-in Value or Resale Value (optional) :	_____	\$ 9,281
Net Depreciation Value :	_____	\$ 83,530

OWNING COSTS

Depreciation :

$$\frac{\text{Net Depreciation Value}}{\text{Depreciation Period in Hours}} = \frac{\$ 83,530}{10,000} = \underline{\hspace{2cm}} \quad \$ 8.35$$

Interest, Insurance, Taxes :

Depreciation Period : 4 Years

$$\text{Trade-in value rate (r)} = \frac{\text{Trade-in Value or Resale Value}}{\text{Delivered Price}} = \frac{9,281}{92,811} = 0.1$$

$$\text{Factor} = 1 - \frac{(n - 1)(1 - r)}{2n} = 1 - \frac{(4 - 1)(1 - 0.1)}{2 \times 4} = 0.66$$

Annual Rates : (Int. % + Ins. % + Taxes % = %) ÷ 100 = 0.14

Approximate Annual Use : _____ Hours

$$\frac{\text{Factor} \times \text{Delivered Price} \times \text{Annual Rates}}{\text{Annual Use in Hours}} = \frac{0.66 \times 92,811 \times 0.14}{2,500} = \underline{\hspace{2cm}} \quad \$ 3.43$$

Total Owning Costs _____ \$ 11.78

OPERATING COSTS

	Consumption	Unit cost		
Fuel :	12.5 liter / hr	\$ 0.2 / liter	x	= \$ 2.50

Lubricants, Filters and Periodic Maintenance Labor
(Ask your local Komatsu distributor) example = \$ 0.39

Tires
 $\frac{\text{Tire Price}}{\text{Estimated Life}} = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

Repair Cost
(Ask your local Komatsu distributor) = \$ 3.30

Special items _____

Operator's Hourly Wage _____ \$ 16.00

Total Operating Costs : _____ \$ 22.19

TOTAL HOURLY OWNING AND OPERATING COSTS

TOTAL HOURLY OWNING AND OPERATING COSTS

Estimation of The Owinging & Operating Costs

OWNING & OPERATING COSTS

The following tables show application and operating conditions in three categories. Condition 1 is the light duty for machine, conditions 2 is the average and Condition 3 is the severe duty. It is the guide line and can be used with fuel and tire life tables to assist to select fuel and tire costs.

Table 2-1 Application and Operating Conditions

	Condition 1	Condition 2	Condition 3
Crawler type tractors	<ul style="list-style-type: none"> • Pulling scrapers, agricultural implements. • Spreading work. 	<ul style="list-style-type: none"> • Digging, dozing, ripping of soft rock, clay, most material. • Scraper pushing • Skidding • Land clearing 	<ul style="list-style-type: none"> • Digging, dozing, ripping of hard rock.
Dozer shovels	<ul style="list-style-type: none"> • Loading of light material from stock pile with substantial Idle time. 	<ul style="list-style-type: none"> • Continuous loading from stock pile. • Light excavation and loading. 	<ul style="list-style-type: none"> • Bank excavation and loading. • Loading of blasted material.
Pipelayers	<ul style="list-style-type: none"> • Operation on stable ground, a little incline of machine. 	<ul style="list-style-type: none"> • Mainly pipe laying operation. 	<ul style="list-style-type: none"> • Operation on poor ground, or on hard rock.
Hydraulic excavators	<ul style="list-style-type: none"> • Slope finishing, light material digging, and other light-duty operation. 	<ul style="list-style-type: none"> • Mainly excavating and loading. • Breaker operation. 	<ul style="list-style-type: none"> • Excavation of hard bank.

Table 2-2 Application and Operating Conditions

	Condition 1	Condition 2	Condition 3
Rigid dump trucks	<ul style="list-style-type: none"> • Level or favorable well-maintained haul road. 	<ul style="list-style-type: none"> • Various operation at mine, quarry and construction site. 	<ul style="list-style-type: none"> • Remarkable overloading • Steep or rough (poor) haul roads. • High load factor. (See Fuel Consumption in this section)
Articulated dump trucks	<ul style="list-style-type: none"> • Level or favorable well-maintained haul road. 	<ul style="list-style-type: none"> • Steep, rough or muddy haul condition 	<ul style="list-style-type: none"> • Remarkable overloading • Remarkable steep, rough or muddy haul road
Motor graders	<ul style="list-style-type: none"> • Finishing and other light-duty operations. 	<ul style="list-style-type: none"> • Mainly road maintenance, repair and construction. • Snow removal 	<ul style="list-style-type: none"> • Maintenance or repair of hard surface road, remarkable scarifying and or ripping operation.
Compactors	<ul style="list-style-type: none"> • Spreading and compaction of sandy soil. 	<ul style="list-style-type: none"> • Spreading and compaction of various types of soil with some rocks. • Break-down of comparatively small wooden items. 	<ul style="list-style-type: none"> • Spreading and compaction of rocky material, high impact conditions. • Break-down of lumber, electrical equipment, industrial products.
Wheel loaders	<ul style="list-style-type: none"> • Loading of light material from stock pile • Operation with substantial truck waiting time. 	<ul style="list-style-type: none"> • Continuous loading from stock pile • Light-duty excavation and loading. 	<ul style="list-style-type: none"> • Bank excavation and loading. • Loading of blasted rock.
Wheel dozers	<ul style="list-style-type: none"> • Light surface finishing • Spreading light material 	<ul style="list-style-type: none"> • Average surface finishing • Digging and dozing soft earth 	<ul style="list-style-type: none"> • Digging and dozing hard earth

Low: Intermittent work with job efficiency less than 65 %
Material; Easy to excavate

Medium: Digging and loading 65 - 80 % of machine operation hours
Material; Not easy to excavate

High: Work with job efficiency more than 80 %
Direct excavation needed sometimes.

Model	Fuel consumption

CONDITIONS:

- Low : High ratio of loading time to cycle time, good haul road conditions
Low truck job efficiency
- Medium : Medium ratio of traveling time to cycle time, medium load factor of truck, and medium haul road conditions and grade
Total resistance; Over 2 % through 10 %
- High : High ratio of traveling time to cycle time, tough load factor of truck, severe haul road conditions and grade
Total resistance; 10 % and above

CONDITIONS:

- Low : Machine movement is mainly consisting of idle running or traveling unloaded
- Medium : Average earth moving, scraper hauling or easy pushing operation
Ripping ratio more than 50%
- High : Ripping, heavy pushing, and operation continued without rest at full horsepower

(2) Hydraulic excavators

Machine	Range Amount	Low		Medium		High	
		U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr
PC1250, LC, SP-7	9.9 ~ 14.9	37.6 ~ 56.3	14.9 ~ 19.8	56.3 ~ 75.1	19.8 ~ 26.5	75.1 ~ 100.2

CONDITIONS:

- Low : Digging account for less than 50% in daily working hours
Loading of low density materials
Unnecessary for big digging force
- Medium : Digging account for 60-85% in daily working hours
After blasting or after dozing
Small rock suitable for the bucket size
- High : Digging account for more than 85% in daily work hours
Direct digging
Heavy duty digging after blasting

Model	Fuel consumption			
	Easy	Average	Rather difficult	Difficult

CONDITIONS:

- Low : Variable travel times with the majority of the travel time attributed to segments with total resistance less than 4%
Abnormal operating efficiency with significant periods of wait time or delays
- Medium : Average travel times with a balance between travel time along routes in excess of 10% total resistance and routes less than 4% in total resistance
Normal operating efficiency with occasional periods of wait time or delays
- High : Long travel times with the majority of the travel time attributed to road segments in excess of 10% total resistance
Highly efficient applications with minimum delay or wait periods

(4) Wheel loaders

CONDITIONS:

- Low : Low production aggregate truck loading, large amount of idling time
- Medium : Loading to stock-pile dump trucks
Short time waiting hours for dump trucks
- High : Continuous loading
Short time waiting hours for dump trucks
Digging hard bank
Takes a lot of time for digging
Load and carry operation with high productivity

Mining

(5) Wheel dozers

Machine	Range	Low		Medium		High	
	Amount	U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr
WD600-3		9.2 ~ 12.9	34.8 ~ 48.8	12.9 ~ 16.2	48.8 ~ 61.5	16.2 ~ 21.5	61.5 ~ 81.3

CONDITIONS:

- Low : Cleaning a surface of a hauling road, ground around large shovels and hoppers (collecting fallen stones).
- Medium : Stock piling
Dozing of crushing rock
- High : Reclamation
Dozing after digging
Pusher using scraper

(6) Motor graders

Machine	Range	Low		Medium		High	
	Amount	U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr	U.S. Gal/hr	ltr./hr
GD825A-2		4.0 ~ 6.5	15.3 ~ 24.5	6.5 ~ 8.9	24.5 ~ 33.7	8.9 ~ 11.3	33.7 ~ 42.9

CONDITIONS:

- Low : Traveling Finishing
Grading of light materials
- Medium : Light duty road maintenance
Scarifying
- High : Ripping
Heavy duty road maintenance

- *(1) Includes lubricant oil of compressor for Portable Air Compressor
- *(2) Includes oils in the torque converter, main clutch and steering cases, differential, etc.
- *(3) Includes oils in the tandem case of Motor Grader

Table 4 Approximate Tire Life

Machine	Easy Condition	Medium Condition	Severe Condition
Off-Highway Dump Trucks	4,000 ~ 6,000	2,000 ~ 4,000	1,000 ~ 2,000
Articulated Dump Trucks	7,000	5,000	3,000
Motor Graders	3,000	2,000	1,000
Wheel Loaders	4,000 ~ 6,000	2,000 ~ 4,000	1,000 ~ 2,000
Wheel Dozers	3,000	2,000	1,000
Hydraulic Excavators	3,000	2,000	1,000
	Traveling on well-maintained roads, or in silt or sand, tire wear is normal.	Traveling on gravelly surfaces, tire wear is normal but occasionally cut by rocks.	Tire wear mostly due to rock-cut, liable to puncture frequently.

The life varies with brand and material. Tires may be used above or below the tire life expectancy given in this table.

Table 5 Approximate Usable Hours of Special Items

Item	Easy Range	Medium Range	Severe Range
Ripper Point	150	30	15
Shank Protector	1,500	450	150
Shank	7,000	3,500	2,000

Optimum Fleet Recommendation (OFR) software program is available for Komatsu distributors.
The OFR is able to simulate and recommend optimum fleet for the targeted production with followings.

1. Machine selection based on site conditions and target of production.
2. Estimation of each machine's production.
3. Estimation of owning and operating costs.
4. Estimation of production cost.

Available machine type in the database

1. Dump truck
2. Wheel loader
3. Hydraulic excavator
4. Bulldozer
5. Mobile crusher & recycler

Computer processing

Report contents

1. Production condition, object material, cost data
2. Optimum machine combination
3. Production
4. Number of units
5. Production cost

For Customer;

Please contact the nearest Komatsu distributor with your specific conditions, application and requirements.

About Repair and Maintenance Cost Estimation

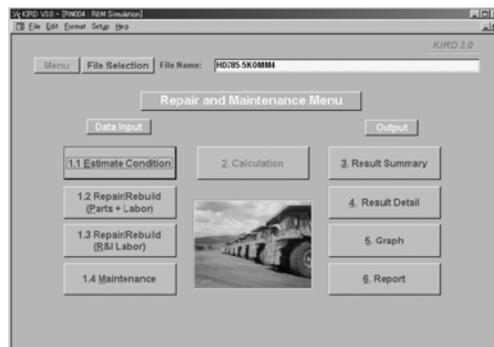

Repair and Maintenance cost is a part of the owning and operating cost.

Repair and Maintenance cost estimating software is available for Komatsu distributors.

The system is called KIRD (Komatsu Information on Reliability and Durability).

By using the KIRD, we can calculate Repair and Maintenance cost for Komatsu large sized equipment with local conditions such as followings.

1. Parts price (Each country has different import duty, transportation charge and etc.)
2. Hourly labor charges
3. Lubricants prices
4. Repairing methods (Repair option)
 - Rebuild
 - REMAN (Komatsu component exchange)
5. Man- hours
6. Component and system replacement intervals per operating conditions
 - Kind of job
 - Environments
 - Handling materials
 - Operating methods

For Customer;

Please contact the nearest Komatsu distributor with your specific model, application and requirements.
